

Functional Inorganic Materials

Fall 2023

Mondays: 10.15 - 12.00
Thursdays: 10.15 - 12.00

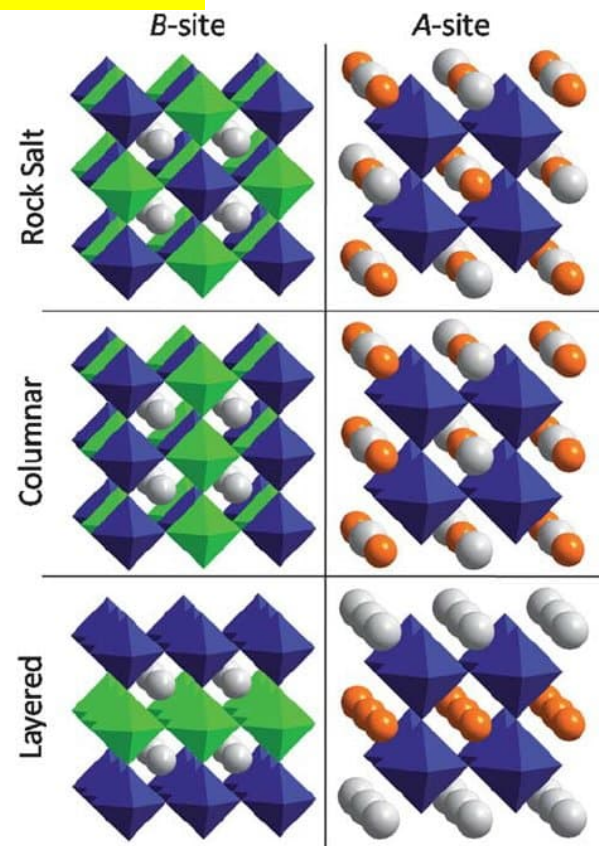

Lecture hall locations: U7 in Otakaari 1 / U-wing
Ke1 in Kemistintie 1 (CHEM building)

You can use <https://usefulaaltomap.fi/> to see the exact location of U7.

#	Date	Place	Who	Topic
1	Mon 4.9.	U7 (U135a)	Maarit	Introduction + Materials design
2	Thu 7.9.	Ke1 (A305)	Antti	Introduction + Computational materials design
3	Mon 11.9.	U7 (U135a)	Maarit	Superconductivity: High- T_c superconducting Cu oxides
4	Thu 14.9.	Ke1 (A305)	Maarit	Magnetic oxides
5	Mon 18.9.	U7 (U135a)	Maarit	Ionic conductivity (Oxygen): Oxygen storage and SOFC
6	Thu 21.9.	Ke1 (A305)	Maarit	Ionic conductivity (Lithium): Li-ion battery
7	Mon 25.9.	U7 (U135a)	Antti	Thermal conductivity
8	Thu 28.9.	Ke1 (A305)	Antti	Thermoelectricity
9	Mon 2.10.	U7 (U135a)	Antti	Piezoelectricity
10	Thu 5.10.	Ke1 (A305)	Antti	Pyroelectricity and ferroelectricity
11	Mon 9.10.	U7 (U135a)	Antti	Luminescent and optically active materials
12	Thu 12.10.	Ke1 (A305)	Maarit	Hybrid materials

DOUBLE PEROVSKITES

- FOR EXAMPLE: Two different cations (**B'** and **B''**) occupy the **B**-site in ABO_3 perovskite with 50%/50% ratio and in an ordered manner \rightarrow **B**-site ordered double perovskite
- Example of B-site ordered double perovskites: Sr_2FeMoO_6
- Similarly, there are A-site ordered double perovskites
- Also triple perovskites are possible, e.g. $A'A''_2B_3O_9$

LECTURE 4: Magnetic (Oxide) Materials

- ❖ Electromagnets & **Permanent magnets**
- ❖ Magnetic field strength, Magnetization, Magnetic susceptibility
- ❖ Dia-, Para-, Ferro-, Ferri- & Antiferromagnetic
- ❖ Type of ordering: unpaired electrons & crystal structure
- ❖ Curie-Weiss Law
- ❖ Magnetic moment → Chemistry
- ❖ Superexchange [& Double exchange interactions]
- ❖ (Double) Perovskite & (Inverse) Spinel structures
- ❖ Hard versus Soft Magnets: Coercivity field
- ❖ [Physics: Strongly Correlated Electron Oxides]

LECTURE EXERCISE 4

1. Considering the inverse spinel crystal structure of magnetite Fe_3O_4 , please explain from which ions the net magnetic moment ($4 \mu\text{B}$) is derived from.
2. Consider the hypothetical case that magnetite would have normal (non-inverse) spinel structure. What kind of magnetic properties you would then expect?
3. $\text{Sr}_2\text{FeMoO}_6$ is one of the rare halfmetallic materials (simultaneously metallic and ferro/ferrimagnetic). Give a rational explanation for the fact that its T_c is higher than those of the related $\text{Ca}_2\text{FeMoO}_6$ and $\text{Ba}_2\text{FeMoO}_6$ compounds.

EXTRA: Make a quick search (lecture slides and/or literature) for few representative soft and hard magnetic materials. Did you find/can you propose any specific applications for the materials of your choice?

ELECTROMAGNET

AN ELECTROMAGNET IS A TYPE OF MAGNET IN WHICH THE MAGNETIC FIELD IS PRODUCED BY AN ELECTRIC CURRENT. THE MAGNETIC FIELD DISAPPEARS WHEN THE CURRENT IS TURNED OFF. ELECTROMAGNETS USUALLY CONSIST OF WIRE WOUND INTO A COIL.

PERMANENT MAGNET

A PERMANENT MAGNET IS AN OBJECT MADE FROM A MATERIAL THAT IS MAGNETIZED AND CREATES ITS OWN PERSISTENT MAGNETIC FIELD. AN EVERYDAY EXAMPLE IS A REFRIGERATOR MAGNET USED TO HOLD NOTES ON A REFRIGERATOR DOOR.

Strongest electromagnets are based on superconducting wires (Lecture 3)

MAGNETISM in BRIEF

- Magnet: solid that creates a magnetic field
 - (1) Electromagnet: electric current (through a coil)
 - (2) **Permanent magnet: unpaired electrons**

PERMANENT MAGNETS

- Each electron is a small magnet due to its spin
- In most materials, the countless electrons have randomly oriented spins, leaving no magnetic effect on average
- In some rather rare magnetic materials, many of the electron spins are aligned in the same direction, such that they create a net magnetic field
- There is also an additional (minor) magnetic field that results from the electron's orbital motion (cf. electromagnets)
- **Magnetic properties of solids depend on:**
 - **electron configuration**
 - **crystal structure**

HOW STRONG THE MAGNET IS ?

- Magnetic field strength (H): magnetic field produced by the flow of current in a wire (A/m) → **Örsted (Oe)**
- Magnetic flux density (B): total magnetic field including the contribution (magnetization M) of the magnetic material in the field (Nm/A) → **Tesla (T)**
- **$H = B/\mu - M$**
- Human body: 3×10^{-10} T
- Earth surface: 3×10^{-5} T
- Near household wiring: 10^{-4} T
- Household (“refrigerator”) magnet: 0.3 T
- Mineral magnetite (Fe_3O_4): 0.4 T
- Strongest permanent magnet ($\text{Nd}_2\text{Fe}_{14}\text{B}$; General Motors & Sumitomo 1984): 1.5 T
- Magnet in MRI device: 2 T
- Electromagnet with Cu wires: 2 T
- Electromagnet with (high- T_c) superconducting wires: 33 T
- Record achieved with the strongest destructive pulsed magnet: 850 T

APPLICATIONS of ELECTROMAGNETS

Superconducting Magnets

- Solenoid as in conventional electromagnet.
- But once current is injected, power supply turned off, current and magnetic field stays forever...
...as long as $T < T_c$

900 MHz NMR (UW Chemistry)

21.7 T field

Magnets for MRI

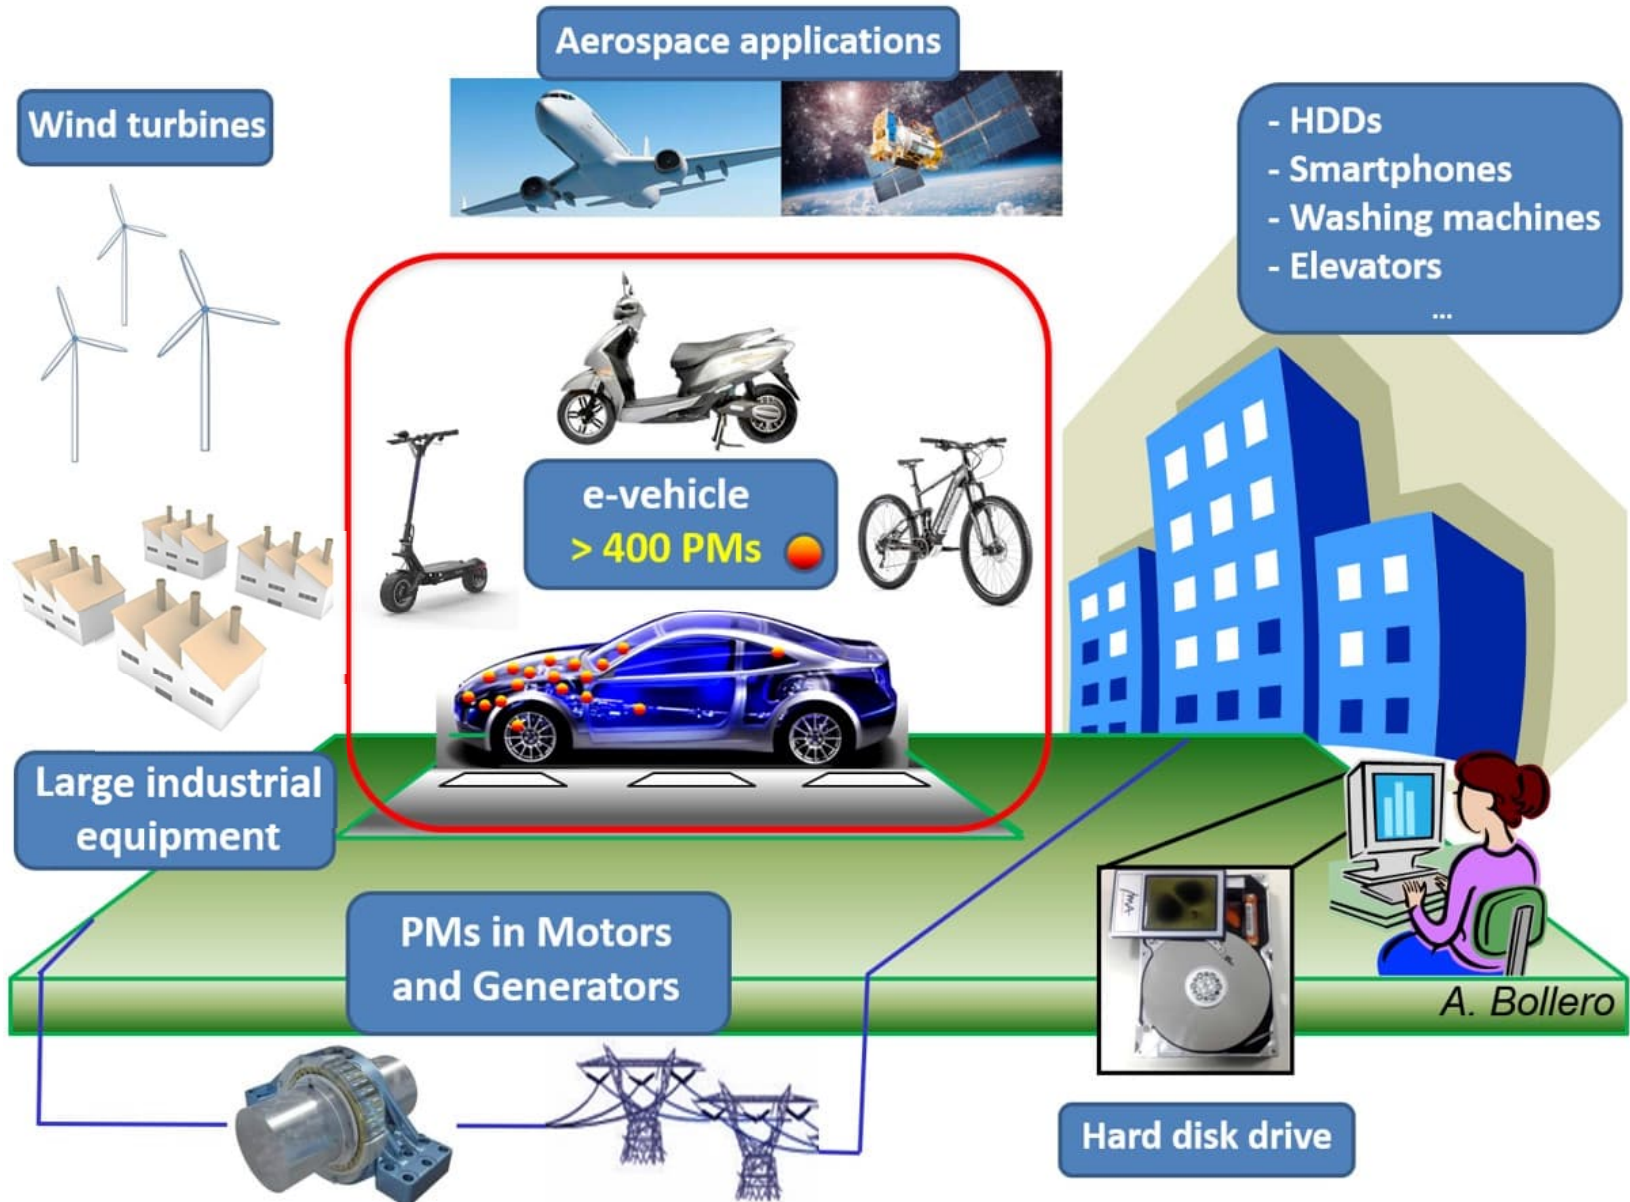

- Magnetic Resonance Imaging typically done at 1.5 T
- Superconducting magnet to provides static magnetic field
- Spatial resolution of positions of tracer atomic nuclei.

Large scale applications

APPLICATIONS of PERMANENT MAGNETS

MAGNETIC MATERIALS: with unpaired electrons

<p>Ferromagnetic</p> 	<p>Below T_C, spins are aligned parallel in magnetic domains</p>
<p>Antiferromagnetic</p> 	<p>Below T_N, spins are aligned antiparallel in magnetic domains</p>
<p>Ferrimagnetic</p> 	<p>Below T_C, spins are aligned antiparallel but do not cancel</p>
<p>Paramagnetic</p> 	<p>Spins are randomly oriented</p>

T_C : Curie temperature

T_N : Neel temperature

Diamagnet:

- Electron motion in orbitals

Pauli paramagnet:

- Delocalized electrons in metal

MAGNETIC SUSCEPTIBILITY (χ)

- Magnetization (M):

The strength of the magnetic field induced in the material in an external magnetic field (H)

- Magnetic susceptibility: $\chi = M / H$

- χ Can be positive or negative

Usually measured using a so-called SQUID (superconducting quantum interference device) magnetometer operating up to ~9 T

DIAMAGNETISM (“NON-MAGNETIC”)

- All materials are diamagnetic
- Due to motion of all electrons in atoms
- Diamagnetic material repels external field ($\chi < 0$)
- Diamagnetism is of several orders of magnitude weaker phenomenon compared to other phenomena of magnetism

(material is said to be diamagnetic only if it does not show other forms of magnetism)

- e.g. water: $\chi = -9.05 \times 10^{-6}$
- So-called pyrolytic carbon is a particularly strong diamagnet (χ up to -400×10^{-6})
- Superconductors are perfect diamagnets and repel perfectly external magnetic field (Meissner) in their superconducting state: $\chi = -1$

Pyrolytic carbon bar levitates above permanent magnet

PARAMAGNETISM

- Due to unpaired electrons (stronger effect than diamagnetism)
- In the absence of external magnetic field the magnetic moments of the spins of unpaired electrons are randomly oriented due to thermal agitation, but in an external magnetic field the moments tend to align with the field
- Positive magnetization effect ($\chi > 0$)
- Magnetization disappears as soon as the external magnetic field is removed
- Examples
 - many transition metal complexes/compounds
 - some salts
 - some molecules (e.g. NO_2)
 - some metals (e.g. Al, Pt)

parallel alignment

Ferromagnetism

FERROMAGNETISM

- Below a certain temperature (Curie temperature T_C) magnetic moments of individual electrons align spontaneously (in a parallel way) → PERMANENT **MAGNET**
- Very strong magnetic effect
- Curie-Weiss Law: $\chi = C/(T-\theta)$; θ = Weiss temperature
- Ferromagnetic metals: Fe, Co, Ni, Gd, Tb
- Ferromagnetic intermetallic compounds, e.g. SmCo_5 , $\text{Nd}_2\text{Fe}_{14}\text{B}$
- Ferromagnetic oxides, e.g. CrO_2 ($T_C=392$ K)
- Heusler-metal alloys, e.g. Cu_2MnSn
(individual metals are not ferromagnetic)

ANTIFERROMAGNETISM

- Below a certain temperature (Neel temperature T_N) magnetic moments of individual electrons align spontaneously (in an antiparallel way)
- There are multiple possible patterns for antiparallel arrangement
- $\chi = C/(T + \theta)$
- e.g. NiO

Ferromagnetism

Parallel
coupling

Antiferromagnetism

Antiparallel
coupling

Ferrimagnetism

Antiparallel

Ferromagnetism in metals

- Only Fe, Co, Ni RT-FM
- Besides unpaired electrons, “exchange interaction” condition should be fulfilled
- This depends on crystal structure/atomic distances:
 - normal Fe FM, but austenite-type Fe not
 - pure Mn not FM (too short Mn-Mn distance), but some Mn alloys are (longer Mn-Mn distance)

Curie temperatures (in K)

■	Co	1388

MAGNETIC SUSCEPTIBILITY

Magnetization (M):

magnetic field induced in sample in external magnetic field (H)

Magnetic susceptibility: $\chi = M / H$

DIAMAGNET: $\chi < 0$ (very small)

PARAMAGNET: $\chi > 0$ (very small)

FERROMAGNET: $\chi > 0$ (very large)

ANTIFERROMAGNET: $\chi > 0$ (small)

FERRIMAGNET: $\chi > 0$ (large)

Compound	Type of Magnetism	χ at 300K (cm ³ /mol)
SiO ₂	Diamagnetic	- 3 x 10 ⁻⁴
Pt metal	Pauli paramagnetic	+ 2 x 10 ⁻⁴
Gd ₂ (SO ₄) ₃ ·8H ₂ O	Paramagnetic	+ 5 x 10 ⁻²
Ni-Fe alloy	Ferromagnetic	+ 10 ⁴ - 10 ⁶

MAGNETIZATION in DIFFERENT MAGNETIC MATERIALS

CURIE LAW

- Temperature dependence of magnetization of paramagnetic materials
- External field tends to align magnetic moments, while thermal energy works to the opposite direction

Curie law: $\chi = C/T$

$$C = N_A^2 \mu^2 / 3 R$$

N_A = Avogadro constant

R = gas constant

μ = magnetic moment

MAGNETIC MOMENT (μ)

- $\mu \neq f(T)$
- $\mu_{\text{eff}} = \mu / \mu_B$ ($\mu_B = \text{Bohr magneton} = eh/4\pi m_e c$)
- Magnetic moment consists of terms due to spin (S) and orbital motion (L)
- For 3d transition metals L is meaningless:
 $\mu_{\text{eff}} \approx g\sqrt{S(S+1)}$ (free electron: $g = 2.00023$)

electron spinning on its axis \uparrow or \downarrow gives the spin magnetic moment

electron moving in its orbital creates an additional magnetic field, leading to the orbital magnetic moment

Number of unpaired electrons	Spin-only moment / μ_B
1	1.73
2	2.83
3	3.87
4	4.90
5	5.92

Ion	Number of unpaired electrons	Spin-only moment / μ_B	observed moment / μ_B
Ti ³⁺	1	1.73	1.73
V ⁴⁺	1		1.68–1.78
Cu ²⁺	1		1.70–2.20
V ³⁺	2	2.83	2.75–2.85
Ni ²⁺	2		2.8–3.5
V ²⁺	3	3.87	3.80–3.90
Cr ³⁺	3		3.70–3.90
Co ²⁺	3		4.3–5.0
Mn ⁴⁺	3		3.80–4.0
Cr ²⁺	4	4.90	4.75–4.90
Fe ²⁺	4		5.1–5.7
Mn ²⁺	5	5.92	5.65–6.10
Fe ³⁺	5		5.7–6.0

PARAMAGNETIC

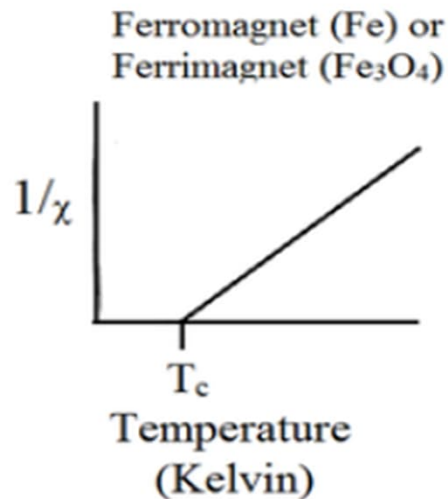

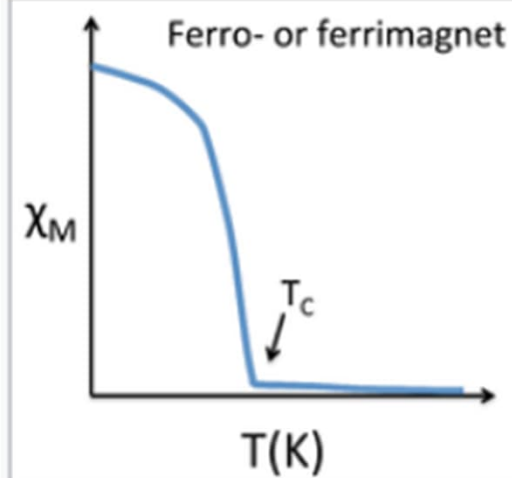

CURIE-WEISS LAW

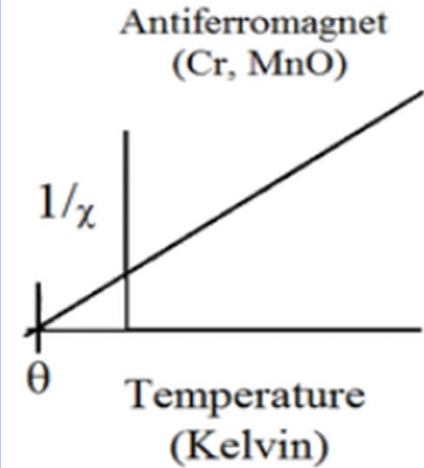

$$\chi = C/T - \theta (\approx T_c)$$

$$\chi = C/T + \theta (\approx T_N)$$

PEROVSKITE OXIDES AMO_3

- Magnetic interactions are maximized and transition temperature increased by:
 - decreasing $M-O-M$ bond length
 - increasing $M-O-M$ bond angle (closer to 180°)
 - these two requirements are often contradictory

$LnMnO_3$

Y.H. Huang, H. Fjellvåg, M. Karppinen, B.C. Hauback, H. Yamauchi & J.B. Goodenough, Crystal and magnetic structure of the orthorhombic perovskite $YbMnO_3$, *Chemistry of Materials* **18**, 2130 (2006).

FERROMAGNETIC $A_2\text{FeMoO}_6$ Double Perovskite (Halfmetal)

- With decreasing $r(A^{II})$ the crystal symmetry is lowered:
 - cubic ($Fm3m$) for $A = \text{Ba}$
 - tetragonal ($I4/m$) for $A = \text{Sr}$
 - monoclinic ($P21/n$) for $A = \text{Ca}$
- T_C shows a bell-shaped behaviour:
 - 330 K for $A = \text{Ba}$
 - 410 K for $A = \text{Sr}$
 - 320 K for $A = \text{Ca}$
- T_C increases with decreasing Fe-O-Mo bond distance and increasing Fe-O-Mo bond angle:
 - when going from Ba to Sr, T_C increases as a consequence of the decreasing bond distance
 - when going from Sr to Ca the effect of the decreased bond distance is less influential than the decrease in the Fe-O-Mo bond angle

Externally
applied
magnetic field.

Hysteresis Loop of Ferromagnetic Materials

- Coersivity field & Remanent magnetization
- Hard FM: wide loop
- Soft FM: narrow loop

HARD MAGNETS

- Magnetically hard (true permanent magnets)
- Retain magnetic properties well when external field is removed/reversed
- Large coercivity
- Needed for many applications (soft magnets needed too for some applications)

Material	Coercivity [T]	Remanence [T]
$\text{BaFe}_{12}\text{O}_{19}$	0.36	0.36
Alnico IV	0.07	0.6
Alnico V	0.07	1.35
Alcomax I	0.05	1.2
MnBi	0.37	0.48
$\text{Ce}(\text{CuCo})_5$	0.45	0.7
SmCo_5	1.0	0.83
$\text{Sm}_2\text{Co}_{17}$	0.6	1.15
$\text{Nd}_2\text{Fe}_{14}\text{B}$	1.2	1.2

ϵ -Fe₂O₃

- Simple & critical-raw-material-free
- Rarest of the Fe₂O₃ polymorphs
- RT ferrimagnet ($T_C \approx 490$ K)
- Colossal coercivity
- Magnetoelectric
- BUT: Challenging synthesis

1934: First observed by Forestier and Guiot-Guillain

1963: Named by Schrader and Buttner

2004: Synthesis of pure ϵ -Fe₂O₃ with giant coercive field values (up to 2 T)
- J. Jin, S.I. Ohkoshi & K. Hashimoto, Adv. Mater. 16, 48 (2004)

State-of-the-art: Synthesized in nano-scale/trace amounts only

- J. Tuček, R. Zbořil, A. Namai & S.I. Ohkoshi, Chem. Mater. 22, 6483 (2010)

2017: ALD of ϵ -Fe₂O₃ thin films

- A. Tanskanen, O. Mustonen & M. Karppinen, APL Mater. 5, 056104 (2017)

Facile ALD process for stable ϵ -Fe₂O₃ thin films

- Just “most common” precursors: FeCl₃ & H₂O
- Deposition temperature: 280 °C
- Substrate: silicon, flexible glass, Kapton, polyimide, etc.

ALD: large-area homogeneity & conformality over porous templates → “MASS production”

A. Tanskanen, O. Mustonen & M. Karppinen, Simple ALD process for ϵ -Fe₂O₃ thin films, *APL Materials* **5**, 056104 (2017).

PHOTOSWITCHABLE: ϵ -Fe₂O₃:Azobenzene

Reversible control of magnetization & coercivity field

ADDITIONAL REMARK

STRONGLY-CORRELATED-ELECTRON MATERIALS

- Common terminology in condensed matter physics !
- “Electron correlation” \approx “Repulsion between (outer) electrons”
- Strongly-correlated-electron materials have partially-filled d or f orbitals with narrow bands
- Once the electron correlations are strong, each single electron has a complex influence on its neighbours and ordinary electronic band structure calculation becomes challenging
- Strongly-correlated-electron materials show unusual but extremely interesting/useful electronic and magnetic properties
- These “extraordinary properties” can be triggered through small stimuli, like temperature, pressure, magnetic field, or CHEMICAL SUBSTITUTION
- Many transition metal oxides are strongly-correlated-electron materials: high- T_c superconductors, magnetic and halfmetallic magnetoresistive oxides, thermoelectrics, Mott insulators, heavy-fermion materials, *etc.*

Strongly-Correlated Finns

Phase Diagram of HTSC

CuO_2 -plane hole concentration
(valence of copper)

↑
Chemistry

DOUBLE EXCHANGE INTERACTION

- Proposed by Clarence Zener in 1951
- Superexchange considers magnetic (AFM or FM) alignment between two atoms with the same valence, while double-exchange considers the cases when one atom has an extra electron compared to the other
- Predicts the relative ease with which an electron may be exchanged between two species, and whether the material is FM, AFM, or neither
- Double-exchange: electron movement from one species to another occurs more easily if the electrons do not have to change spin direction

DOUBLE EXCHANGE

FM

Transfer of the minority spin
can occur only if majority
spins are aligned parallel
Occurs in Mixed Valent
systems

Strongly-Correlated-Electron Materials

- Band-picture does not work
- NOVEL FUNCTIONS

t : overlap of wave functions (= orbitals)

U : strength of electron repulsion (= correlation)
