1

Content

- **Mobile Network Architectures Evolution**
 - MN Arch. Evolution: 2G to 3G
 - Evolved Packet System
 - Core NW Architecture & components
 - Protocols
 - 5G Core Network
 - Service Based Architecture
- **5G Mobile Networks**
 - Requirements and features
- **Cloud-based Mobile Core Networking**
 - Network Function Virtualization
 - Software Defined Networking
 - Core Network Virtualization
- **Evolved RAN: LTE, LTE-Advanced and LTE-Advanced Pro**

© Tarik TALEB 2020

2

Grading Policy

- In-class (or after-class) exercises
 - 30% of course grade
- Assignment
 - Presentation of a scientific publication relevant to beyond 5G
 - Nine white papers to be presented by nine groups during the last three sessions of the course
 - Further instructions will be communicated by Dr. Edward Mutafulungwa
- Examination (Open Book)
 - 40% of course grade
- Reading Material
 - Material for 4G and 5G

© Tarik TALEB 2020 – Basics vs Advanced

3

Important Dates

- Lecture 1: Mon 07.09.20 12:15 - 14:00
- Lecture 2: Fri 11.09.20 12:15-14:00
- Lecture 3: Mon 14.09.20 12:15 - 14:00
- Lecture 4: Mon 21.09.20 12:15 - 14:00
- Lecture 5: Mon 28.09.20 12:15 - 14:00
- Lecture 6: Mon 05.10.20 12:15 - 14:00

- Assignment -
 - Paper presentation day 1: Mon 12.10.2020, 14:00 - 16:00
 - Paper presentation day 2: Wed 16.10.2020, 14:00 - 16:00

- Examination: Tue 20.10.2020 09:00-12:00

© Tarik TALEB 2020

4

Learning Outcome

- Understanding the migration scenarios from 2G/3G to 4G and 5G
- Factual knowledge of EPC, LTE/LTE-Advanced and 5G architecture
- Basic understanding of recent RAN technologies (from LTE towards 5G NR)
- Familiarity with latest developments in NFV, SDN and Network Softwarization
- Development of skills for research and presentation of complex concepts to a general audience
- Development of technical writing skills

© Tarik TALEB 2020

TODAY'S LECTURE

- **Content**

- Mobile Network Architectures Evolution
 - MN Arch. Evolution: 2G, 3G, 4G
 - Evolved Packet System (4G)
 - Core NW Architecture & components
 - Protocols

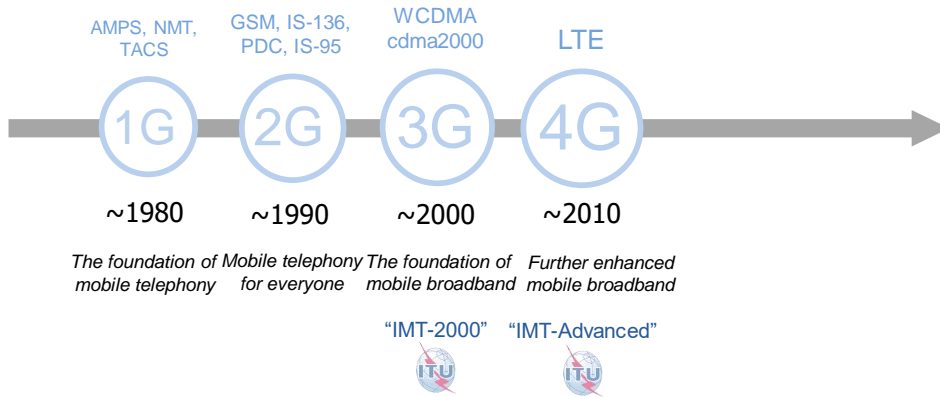

- **Learning Outcome**

- Understanding the migration scenarios from 2G/3G to 4G
- Factual knowledge of EPC

Mobile Network Architecture Evolution

13

Outline

- **Legacy Networks:**
 - GSM
 - GPRS
 - UMTS
- **System Architecture Evolution**
 - Background & requirements
 - Motivation
 - Basic principles
 - Network elements and high level functions
- **Architectural enhancements for E-UTRAN and interoperability with 3GPP and non-3GPP accesses**
 - Interoperability Mobility and handover management
 - Policy Control and Charging (PCC)
 - QoS Provisioning

Main References:

- 1- 3GPP Technical Specifications 23.401
- 2- 3GPP Technical Specifications 23.402

14

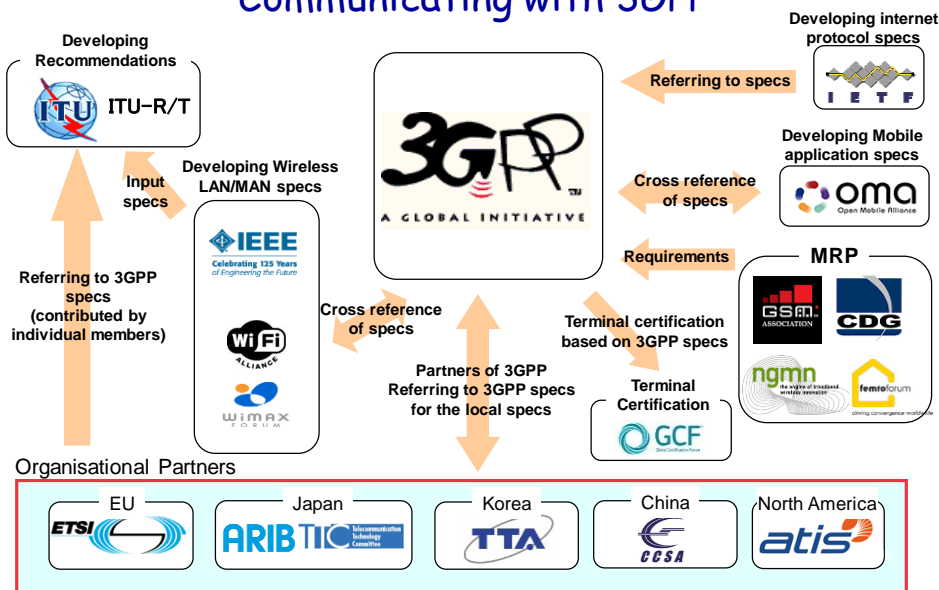

Major Standardization Groups

- **3rd Generation Partnership Program (3GPP)**
 - In existence since 1998
 - Is the most prominent standardization group for mobile networks
 - Developed legacy GSM, GPRS, UMTS, e-UTRAN
 - 5G
- **Telecom & Internet Converged Services & Protocols for Advanced Networks (TISPAN)**
 - Focuses on network interconnection and evolution as part of Next Generation Networks (NGN)
 - IMS
- **WIMAX Forum Networking Group (WMF NWG)**
 - In existence since 2001
 - Developed WIMAX
 - Competitor to 3GPP's EPS
 - Integration between the two systems is also considered
- **3rd Generation Partnership Project Nr. 2 (3GPP2)**
 - Counterpart of 3GPP for the American, Pacific and partially Asian market
 - Developed several specifications
 - CDMA2000 ©, 1xRTT, EV-DO or HRPD
 - Interworking between 3GPP2 and 3GPP networks are considered

17

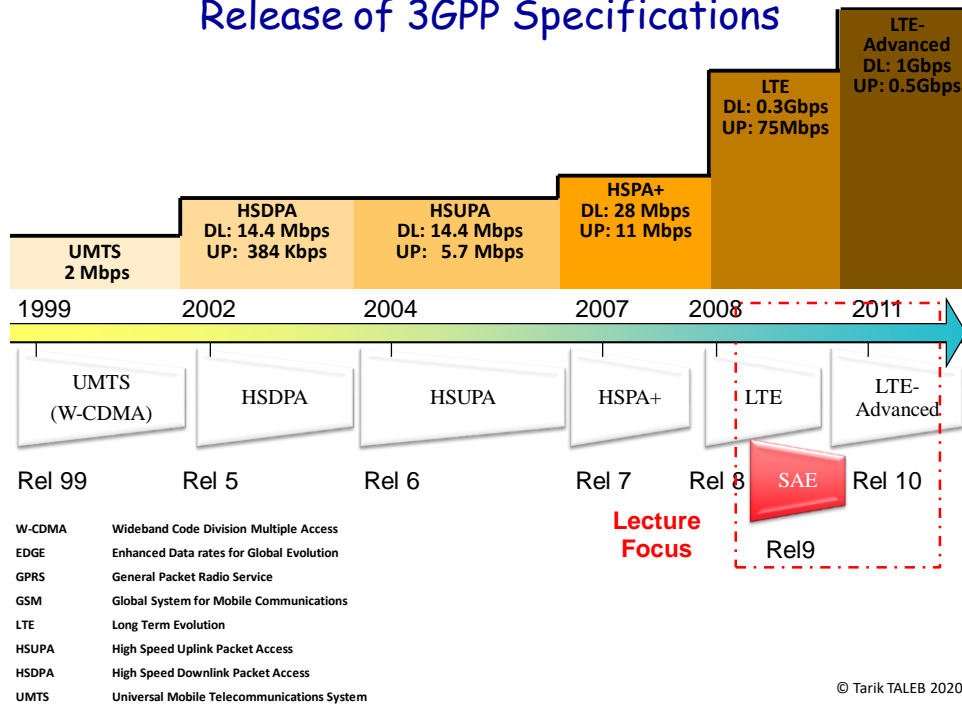

3GPP Access Evolution

- **2G or GSM/CS**
 - Voice communication
 - narrowband, real-time, circuit switched
 - WAP or HSCSD as extensions to enable data communications but limited success
- **2.5G (GPRS/PS, Enhanced Data Rates for GSM Evolution EDGE)**
 - Adding Packet Services
 - Theoretical data rates up to 384 Kbps
 - Not “always-on” IP connectivity:
 - IP address is assigned only when “PDP context” is established for data transmission
- **3G or UMTS**
 - Built on WCDMA
 - High peak data rates: 2Mbps
 - Extended by HSDPA (Rel. 5), HSUPA (Rel. 6), and HSPA+ (Rel. 7)
 - IMS as service control layer for PS core network
- **4G**
 - Long Term Evolution (LTE)
 - LTE-Advanced
- **Beyond 4G**
 - 5G SBA
 - 5G NR

Release of 3GPP Specifications

19

Nomenclature (1)

Long Term Evolution

- Evolved UMTS Radio Access (E-UTRA) (Physical and link layers)

E-UTRA Network (E-UTRAN)

- Radio Network's Functions

Evolved Packet Core

- System Architecture

© Tarik TALEB 2020

20

Nomenclature (2)

Evolved 3GPP System

System Architecture Evolution
(SAE)

Evolved Packet System (EPS)

EPS = Evolved UTRAN + Evolved Packet Core

3G+, 3.5G, 4G, 5G, etc

- Advanced phases of the system design
- Marketing terms

21

Legacy 3GPP Networks

22

GSM 2G Architecture

© Tarik TALEB 2020

23

Circuit Switch

vs

Packet Switch

- Reserved bandwidth
- Time based billing
- Fixed access time
- Suitable to real-time applications
- Lower bit rates (14.4 kbps)
- Inefficient use of resources

- Shared bandwidth
- Traffic based billing
- Variable access times
- Ideal for "data" traffic
- Higher bit rates (up to 170 kbps)

**2.5 G
(GPRS)**

27

Long Term Evolution

28

LTE Features & Requirements (1/2)

- **“Always on” IP connectivity**
- **All-IP Network (AIPN)**
 - Providing economy of scale and spectrum reuse
 - Supporting full mobility and global roaming
 - Ensuring seamless service across different radio access
 - Efficiently interworking with non-3GPP accesses
 - Compatible with legacy 3GPP networks
 - Ensuring high QoS
 - Affording high user data rates for both uplink and downlink
 - Lower latencies in user data and control planes
 - Supporting diverse mobile network services, both unicast and multicast
- System with **reduced cost (CAPEX and OPEX)**
 - Reduced number of network elements – flatter architecture
 - Less complexity in RAN and economic usage of backhaul capacity
- System with **improved capacity and coverage**
 - Usage of the orthogonal frequency-division multiplexing (OFDM)
 - Spectrum efficiency and reuse
- System with **high level of security**

© Tarik TALEB 2020

29

Key Features/Requirements (2/2)

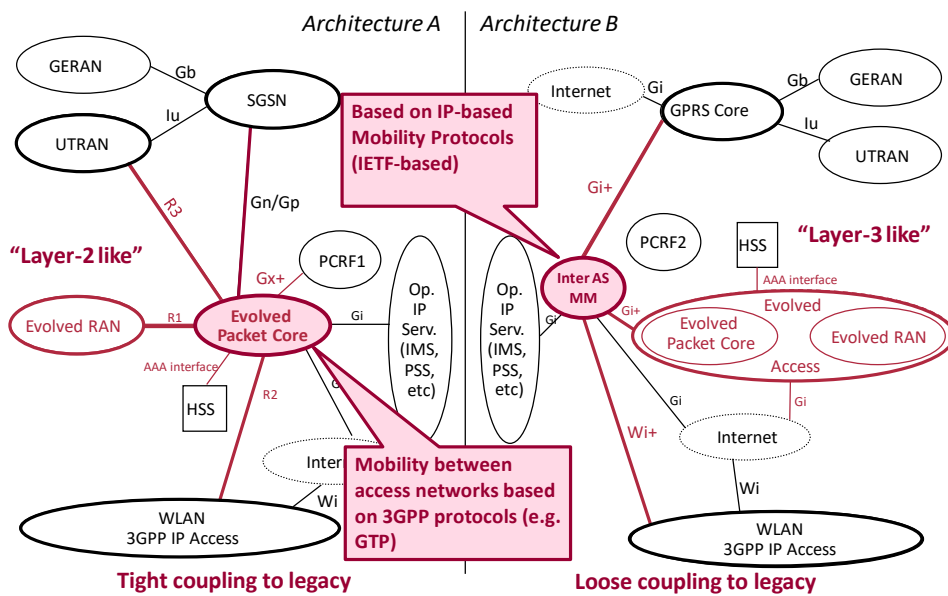

- **Simple protocol architecture**
 - Shared channel based
 - PS mode only with VoIP capability (No CS)
- **Simple Architecture**
 - eNodeB as the only E-UTRAN node
 - Fully meshed approach with tunneling mechanism over IP transport network
 - Iu Flex approach
 - Smaller number of RAN interfaces
 - eNodeB ↔ MME/SAE-Gateway (S1)
 - eNodeB ↔ eNodeB (X2)
- **Compatibility and inter-working with earlier 3GPP Releases**
- **Inter-working with other systems, e.g. cdma2000**
- **FDD and TDD within a single radio access technology**
- **Efficient Multicast/Broadcast**
 - Single frequency network by OFDM
- **Support of Self-Organizing Network (SON) operation**

36

Architectural Aspects of EPC

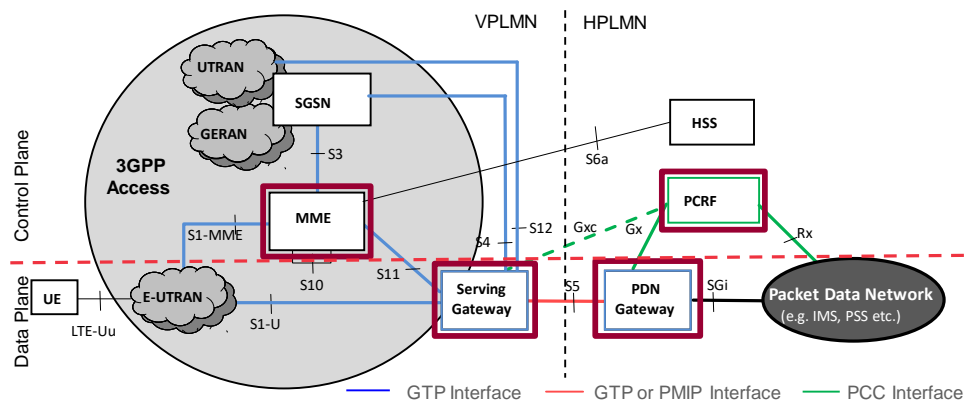

- 3GPP accesses
- non-3GPP accesses
 - Untrusted non-3GPP
 - Requirement for a special gateway (evolved Packet Data Gateway) for a secure access of UE to EPC
 - Trusted non-3GPP
 - ePDG not required

© Tarik TALEB 2020

37

EPS for 3GPP Accesses

- **PDN GW:** IP address allocation, charging and enforces QoS
- **Serving GW:** Local mobility anchor for intra-3GPP HO
- **MME:** Mobility management entity for intra-3GPP mobility, paging, authentication, bearer management, etc.
- **PCRF:** QoS and charging rule provisioning

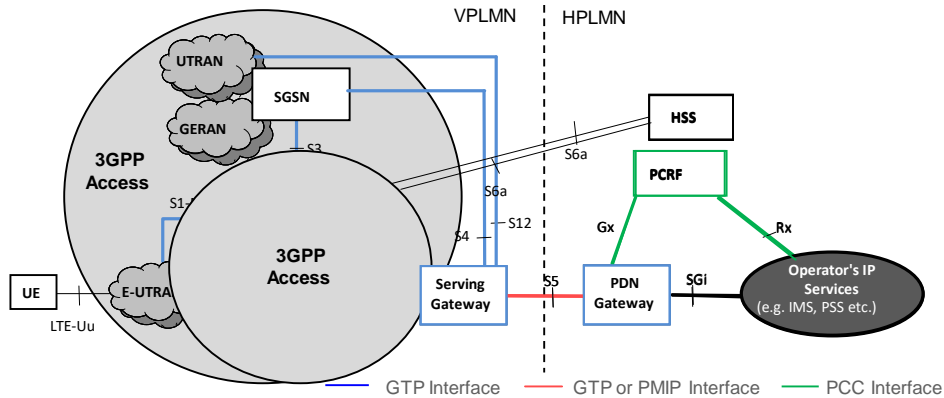

© Tarik TALEB 2020
