

Aalto University  
School of Electrical  
Engineering

**Postgraduate course on electronic circuit  
design**

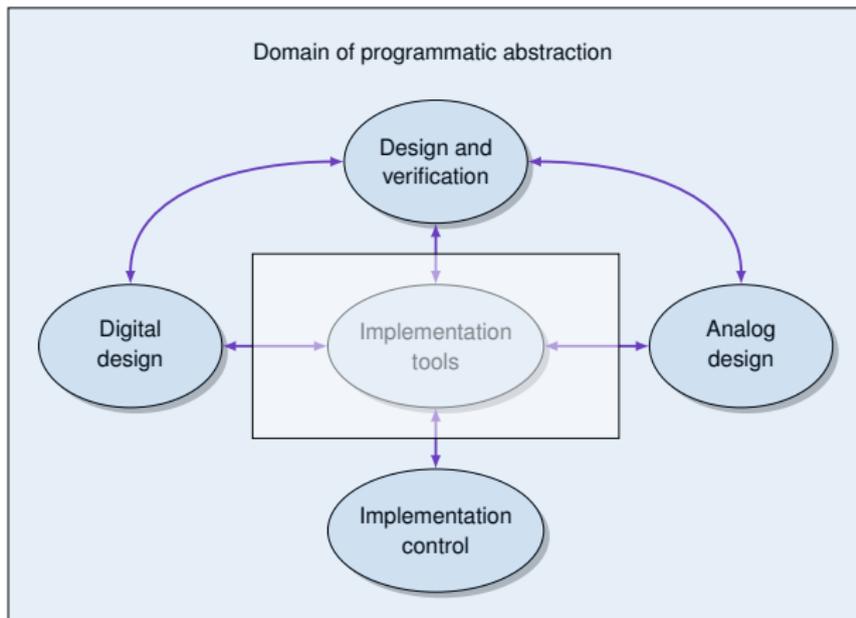

**Memory mapped microcontroller  
configuration on FPGA for controlling  
custom things.**

Marko Kosunen

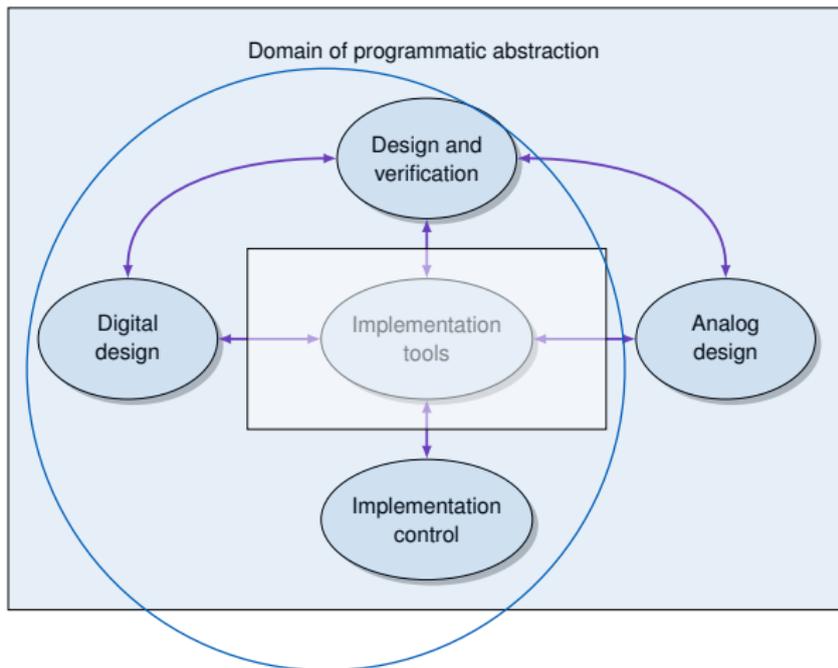

Department of Electronics and Nanoengineering

October 20, 2020

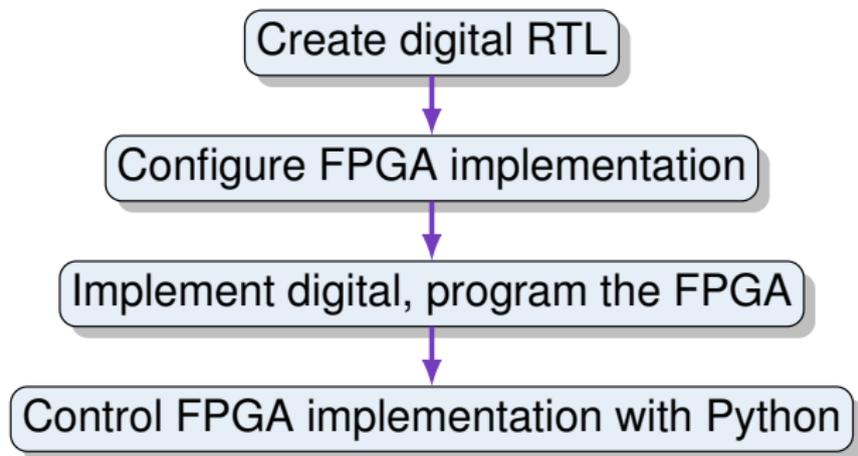

# Programmatic circuit design

# Programmatic circuit design

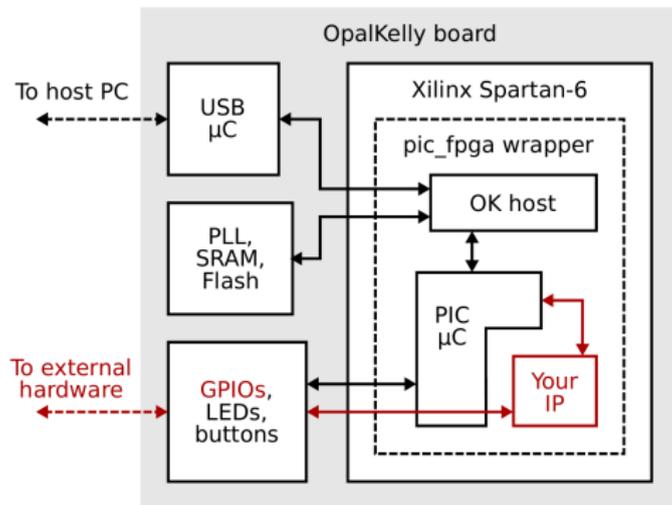

# Product of year 2019: seamless FPGA implementation toolchain

# Course objective:

## Memory mapped microcontroller configuration

- ▶ Host runs python
- ▶ FPGA contains PIC16F34 microcontroller
- ▶ PIC runs assembly
- ▶ PIC *may* communicate with host during execution

## Course objective

- ▶ Course is done in groups of 2
- ▶ You are given VHDL for PIC16F84A microcontroller.
- ▶ You are given example program in assembly and example how to simulate it on with Modelsim.
- ▶ You are given a toolchain to push it and run it on FPGA.
- ▶ Task:
  - ▶ Implement and control something with microcontroller on FPGA, (E.g. debug SPI slave controller with FPGA).
  - ▶ Control something with the FPGA dev board containing microcontroller and program. E.g. Control your chip with SPI-master implemented as PIC on FPGA.
  - ▶ Your imagination (and FPGA capacity) is the limit.
- ▶ Build process should use Configure && make, GUI for debugging and studies.
- ▶ Extend your capabilities by designing an *Exercise* or *Demo* that can be executed based on given instructions.
- ▶ Presentation or demo session,  $\approx$  15 min.

# Programmatic project management

- ▶ We use Git for everything on this course in order to learn how to use it

# Programmatic project management

- ▶ We use Git for everything on this course in order to learn how to use it
- ▶ We use Git issues and Slack for (shared) communication

# Implementation platform

- ▶ OpalKelly XEM6001 (2 pcs.)
  - ▶ Xilinx Spartan-6 (XC6SLX16 FTG256)
- ▶ OpalKelly XEM6010 (5 pcs.)
  - ▶ Xilinx Spartan-6 (XC6SLX45 FGG484)
- ▶ ModelSim (Student edition available at [https://www.mentor.com/company/higher\\_ed/modelsim-student-edition](https://www.mentor.com/company/higher_ed/modelsim-student-edition))
- ▶ Python 3.6 or newer.

# Phase 1-Implementation platform and Toolchain

- ▶ OpalKelly FPGA. API's and FrontPanel available at Aalto Version <https://version.aalto.fi>
- ▶ Log in there, and I will add you to the Course Group
- ▶ Xilinx ISE required for programming the FPGA. Available:  
Windows 10:  
[https://www.xilinx.com/support/download/index.html/content/xilinx/en/downloadcenter/14\\_7-windows.html](https://www.xilinx.com/support/download/index.html/content/xilinx/en/downloadcenter/14_7-windows.html)  
Other:  
[https://www.xilinx.com/support/download/index.html/content/xilinx/en/downloadcenter/v2012\\_4—14\\_7.html](https://www.xilinx.com/support/download/index.html/content/xilinx/en/downloadcenter/v2012_4—14_7.html)
- ▶ License is “ISE WebPack“ it's downloadable during/after the install procedure.

# Phase 1-Test the implementation platform and toolchain

- ▶ See the Gitlab issue board at [https://version.aalto.fi/gitlab/elec-l3510\\_exec/main/-/boards](https://version.aalto.fi/gitlab/elec-l3510_exec/main/-/boards)
- ▶ Examples and documentation available:
  - ▶ Simulation: [https://version.aalto.fi/gitlab/elec-l3510\\_exec/pic16f84a-vhdl/-/blob/master/README.md](https://version.aalto.fi/gitlab/elec-l3510_exec/pic16f84a-vhdl/-/blob/master/README.md)
  - ▶ FPGA implementation: [https://version.aalto.fi/gitlab/elec-l3510\\_exec/pic-fpga/-/blob/master/README.md](https://version.aalto.fi/gitlab/elec-l3510_exec/pic-fpga/-/blob/master/README.md)
- ▶ Fork these projects to you Groups Gitlab group. Instruction provided  
[https://version.aalto.fi/gitlab/elec-l3510\\_exec/pic16f84a-vhdl](https://version.aalto.fi/gitlab/elec-l3510_exec/pic16f84a-vhdl)
- ▶ Study how to program and simulate program the assembly code with VHDL with examples.
- ▶ Study how to implement the microcontroller on FPGA by getting acquainted with the code in pic-fpga
- ▶ Obtain FPGA board from course personell and test the flow.

# Phase 1-Test the implementation platform and toolchain

- ▶ First phase goal is to establish a script-based programming environment where you can push the design and program on FPGA without opening the gui.
- ▶ We have multiple groups, and collaboration is OK, but leeching is not. Each groups develops a toolchain of their own, but after X weeks you should (perhaps) converge to use the best one of them.

## Phase-2 Implement a memory mapped microcontroller configuration for control of custom blocks.

- ▶ Use SPI as a test case.  
[https://version.aalto.fi/gitlab/elec-l3510\\_exec/spi\\_slave](https://version.aalto.fi/gitlab/elec-l3510_exec/spi_slave)
- ▶ We give you SPI slave VHDL to program on FPGA, but you need to write a Python interface and assembly program to control it (read and Write).

## Phase 3-Excercise or demo

- ▶ You may skip Phase-II if you can.
- ▶ Develop any kind of a memory mapped microcontroller configuration to control anything you want/need in your work or just out of interest.
- ▶ Prepare a demo or course exercise out of your work.
- ▶ Best works are used in coming Bachelor's course "Programmatic circuit design". Eternal glory will be yours.

## Phase 4-Presentations

- ▶ Each group gives a 15 minute slide presentation of their demos/exercises

# Hints-Modularity is the key

- ▶ The most important thing in terms of re-usability:
  - ▶ Example templates are a git module that can be used for project initialization.
  - ▶ Every design should be a Git module
  - ▶ Every sub-design should be utilized as a git sub-module
  - ▶ Using sub-modules requires some advanced Git skills, thus we practice.
- ▶ On git related problems: *every one of them has been solved by someone*. Do a web search `git <myproblem>`.
