Performative Patterns of High Density
Sustainable visions between architecture and landscape

Digital design is driven by thinking in structures and systems, translated into pattern of order and their interaction. The studio is an introduction into such design thinking and emphasizes the exploration of spatial organizational pattern in various levels of abstraction and scale through the integration of computational methods and digital workflow. The studio is organized as post-studio between the professorships of Design of Structures and Computational Methodologies in Landscape Architecture and Urbanism and a continuation of a collaboration with the Singapore University of Technology and Design.

The studio in autumn will explore climate mitigation strategies through the study of performative qualities of organizational patterns on various architectural scales. By viewing the city not anymore as a collection of independent objects but rather as a systemic network of relationships the studio will explore new design strategies to engage with the surrounding urban and green systems and transform these concepts into an articulated landscape as new urban typology grounded in social and environmental sustainability. Computational methods and techniques will be developed to study the relation between buildings, the city and landscape and its underlying flows of different data streams like, people, material and culture, urban green. This knowledge will be used to speculate on how types of urban sustainability aiming at the connection of urban and green systems for future cities, taking the city of Porvoo as a test case.

The studio is organized as an experimental design lab. Teaching will be fully digital and exploring a data-driven encounter with urban phenomena. Studio teaching is supported by intense skill building workshops as well as reading & discussion rounds. The course is aiming at the rethinking of fundamentals of contemporary architecture and landscape architecture and can serve as starting point for a thesis research.

Prerequisite: completed bachelor studies, basic modeling skills in Rhino & basic knowledge of Grasshopper, permission by ARK-E2512 Parametric Design (required)

Credits: 30 ECTS

Participants of the studio will be registered in parallel in the following courses:
ARK-E3009 Design of Structures Studio (12cr), ARK-E2514 Design of Structures Theory (3cr), ARK-E551801 Digital Speculative Urbanism Studio (12cr), ARK-E551001 Digital Speculative Urbanism Lecture (3cr)

Number of participants: max. 30
Time: teaching period I - II, Tuesday 9h-10h & Thursday 9h-17h

Teaching team: Prof. Toni Kotnik, Prof. Pia Fricker, Tina Čerpnjak, Luka Piškorec, Kane Borg (all Aalto) and Prof. Carlos Barron (SUTD)

Climate Change Impact

Change in sea level (meters)

year

Extreme
High
Intermediate-high
Intermediate
Intermediate-low
Low
2000 sea level

NCEM Climate.gov
Adapted from Swart et al., 2017

temperature
From 1880 to 2012, the average global temperature increased by 0.85°C

sea level rise
2065: 24–30 cm
2100: 40–63 cm

global warming 1.5°C // 2°C
Extreme changes: heatwaves, heavy precipitation > flooding, droughts, tsunamis and tropical cyclones, sea level rise

Global net human-caused emissions of CO₂ would need to fall by about 45 percent from 2010 levels by 2030, reaching 'net zero' around 2050.

20

An element, we take it, is a body into which other bodies may be analysed, present in them potentially or in actuality (which of these, is still disputable), and not itself divisible into bodies different in form. That, or something like it, is what all men in every case mean by element.

evaporative/adiabatic cooling

The diagram illustrates the process of evaporative/adiabatic cooling. A large blue water droplet labeled "water (fluid)" is shown. A red arrow labeled "warm air" points towards the droplet from the left. A blue arrow labeled "cold air" points away from the droplet to the right. Above the droplet, an arrow labeled "energy" points upwards towards three smaller blue droplets labeled "water (gas)".

cooling of occupied zone only

minimizing of solar heat gain

plants for shading

Space conditioning relies on both passive and active technologies. Optimizing the building envelope included the specification of solar protective glass (g-value 0.35) with low-emissivity properties, using the internal flora to create shading and natural stratification of temperature, keeping the occupied zones naturally comfortable for visitors. The high amount of daylight (daylight transmittance 0.7) assures growth and flowering of the respective plants. Space conditioning is performed through activation of the radiant concrete floor, whereas fresh air is provided through mechanical yet efficient displacement ventilation - at occupant level only.

environmental concept

The roof gardens. The flat roof demands in the first place systematic utilization for domestic purposes: roof terrace, roof garden. On the other hand, the reinforced concrete demands protection against changing temperatures. Over-activity on the part of the reinforced concrete is prevented by the maintenance of a constant humidity on the roof concrete. The roof terrace satisfies both demands (a rain-dampened layer of sand covered with concrete slabs with lawns in the interstices; the earth of the flowerbeds in direct contact with the layer of sand). ... The roof gardens will display highly luxuriant vegetation. Shrubs and even small trees up to 3 or 4 metres tall can be planted. In this way the roof garden will become the most favoured place in the building. In general, roof gardens mean to a city the recovery of all the built-up area.

Modern Architecture

environment as the other

Every country builds its houses in response to its climate. At this moment of general diffusion, of international scientific techniques, I propose: only one house for all countries, the house of exact breathing. The Russian house, the Parisian, at Suez or in Buenos Aires, the luxury liner crossing the Equator will be hermetically sealed. In winter it is warm inside, in summer cool, which means that at all times there is clean air inside at exactly 18°. The house is sealed fast! No dust can enter it. Neither flies nor mosquitos. No noise!"

Assignment #1: SUN - WIND - WATER

Task: Explore the physical behaviour of your assigned phenomena: sun, wind or water. Each of these phenomena interacts with the field of architecture through different forms, behaviour and stages of matter.

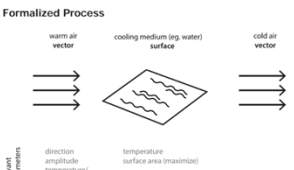

Knowledge Template

Study at least 3 particular physical articulation of your phenomena and extract the most relevant knowledge onto the knowledge template. Enrich the explanation of the underlying physical principle through diagrams and relevant examples.

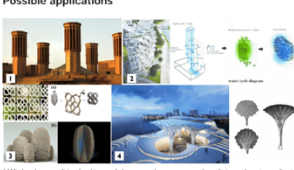

Your findings are the starting point for further research and discussion into those conditions and the computational possibilities to modify and to manipulate matter as a generative design component.

Format: Group work
 Deadline: Monday 20.09.2021/18.00h, MyCourses

Formalized Process

Possible applications

The heat exchange between the air and cooling medium can be direct or indirect. Direct evaporative cooling systems rely on the direct channeling of water into the airflow, while in indirect systems the primary air is cooled but no moisture is added into the air, which can play an important role in building air-conditioning systems. The disadvantage of indirect evaporative cooling technology lies in its high dependency on ambient air conditions.
