## Stokes Theorem

## Stokes theorem

A $(\mathrm{x}, \mathrm{y}, \mathrm{z}) \rightarrow$ vector field $\boldsymbol{\nabla}=\frac{\partial}{\partial \mathrm{x}} \mathbf{a}_{\mathbf{x}}+\frac{\partial}{\partial \mathrm{y}} \mathbf{a}_{\mathbf{y}}+\frac{\partial}{\partial \mathrm{z}} \mathbf{a}_{\mathbf{z}}$

$$
\mathbf{A}=\mathrm{A}_{\mathrm{x}} \mathbf{a}_{\mathbf{x}}+\mathrm{A}_{\mathrm{y}} \mathbf{a}_{\mathbf{y}}+\mathrm{A}_{\mathrm{z}} \mathbf{a}_{\mathbf{z}}
$$

$$
\boldsymbol{\nabla} \times \mathbf{A}=\left|\begin{array}{ccc}
\mathbf{a}_{\mathbf{x}} & \mathbf{a}_{\mathbf{x}} & \mathbf{a}_{\mathbf{x}} \\
\frac{\partial}{\partial \mathrm{x}} & \frac{\partial}{\partial \mathrm{y}} & \frac{\partial}{\partial \mathrm{z}} \\
\mathrm{~A}_{\mathrm{x}} & \mathrm{~A}_{\mathrm{y}} & \mathrm{~A}_{\mathrm{z}}
\end{array}\right|
$$

$$
\int_{S} \boldsymbol{\nabla} \times \mathbf{A} \cdot \mathbf{d} \mathbf{s}=\oint_{C} \mathbf{A} \cdot \mathbf{d} \mathbf{l} \quad \mathrm{C} \text { is a closed contour that bounds } \mathrm{S}
$$

$>$ The total flux of the curl vector field through surface $S$ is equal to the sum of dot products between the tangent vector field of contour $C$ and a vector field $A$ at the contour

## Example problem

$$
\begin{aligned}
& \mathbf{F}=\mathrm{xza}_{\mathrm{x}}+\mathrm{yza}_{\mathbf{y}}+\mathrm{xya}_{\mathbf{z}} \\
& \int_{\mathrm{S}} \boldsymbol{\nabla} \times \mathbf{F} \cdot \mathbf{d s}=\oint_{\mathrm{C}} \mathbf{F} \cdot \mathbf{d l} \\
& \text { sphere } \rightarrow \mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}=4 \\
& \text { cylinder } \rightarrow \mathrm{x}^{2}+\mathrm{y}^{2}=1
\end{aligned}
$$

$>$ Show that stokes theorem is valid for the contour and surface shown in the figure.
> The closed contour C is defined by the intersection of the sphere and cylinder
$>$ The surface S is the part of the sphere that lies inside of the cylinder

## Example problem: Solution 1/7

$\mathbf{F}=x z \mathbf{a}_{\mathrm{x}}+\mathrm{yza} \mathbf{a}_{\mathbf{y}}+\mathrm{xy} \mathbf{a}_{\mathrm{z}}$

Vector $\mathbf{F}$ field is in cartesian coordinates

Surface $S$ is easily described in spherical coordinates

Contour C is easily described in cylindrical coordinates

\end{array}\right)=\left(\begin{array}{ccc}
\sin \theta \cos \phi & \sin \theta \sin \phi & \cos \theta \\
\cos \theta \cos \phi & \cos \theta \sin \phi & -\sin \theta \\
-\sin \phi & \cos \phi & 0
\end{array}\right)\left(\begin{array}{l}
A_{x} \\
A_{y} \\

\end{array}\right)
$$

Note that its only necessary to compute $A_{R}$ since ds always points in the $a_{R}$ direction ds $\rightarrow \mathrm{ds}_{\mathrm{R}} \mathrm{a}_{\mathrm{R}}$

## Conclusions and Next Time

## Summary

> Your choice to parameterize the contour/surface or map the vector field to something that is "naturally aligned" with the contour/surface
> Many EM problems have some sort of cylindrical or radial symmetry giving rise to circular contours and spherical and cylindrical test surfaces. Its often not a bad idea to map the vector field to match
> Stoke's and divergence theorems map between N dimensional and to an $\mathrm{N}-1$ dimensional integrals.
$>$ One side of each theorem is typically easier to evaluate than the other although this depends on the vector field and surface
$>$ Next week Dr. Wallen starts with Chapter 7
> Have a good weekend!
