

TENTATIVE LECTURE SCHEDULE

	Date	Topic
1.	Mon 13.09.	Course Introduction & Short Review of the Elements
2.	Wed 15.09.	Periodic Properties & Periodic Table & Main Group Elements (starts)
3.	Fri 17.09.	Short Survey of the Chemistry of Main Group Elements (continues)
4.	Mon 20.09.	Zn + Ti, Zr, Hf & Atomic Layer Deposition (ALD)
5.	Wed 22.09.	Transition Metals: General Aspects & Pigments
6.	Mon 27.09.	Ag, Au, Pt, Pd & Catalysis (Antti Karttunen)
7.	Wed 29.09.	Redox Chemistry
8.	Mon 04.10.	Crystal Field Theory
9.	Wed 06.10.	V, Nb, Ta & Metal Complexes & MOFs
10.	Fri 08.10.	Cr, Mo, W & 2D materials
11.	Mon 11.10.	Mn, Fe, Co, Ni, Cu & Magnetism & Superconductivity
12.	Wed 13.10.	EXTRA
13.	Fri 15.10.	Resources of Elements & Rare/Critical Elements & Element Substitutions
14.	Mon 18.10.	Lanthanoids + Actinoids & Luminescence (Down/Upconversion)
15.	Wed 20.10.	Inorganic Materials Chemistry Research

EXAM: Thu Oct. 28, 2021

PRESENTATION TOPICS/SCHEDULE

Wed	06.10.	Nb:	Toivonen
Fri	08.10.	Mo:	Ahmed, Shamsad, Svinhufvud
Mon	11.10.	Mn:	Majaniemi, Thakur, Ahkiola
		Ru:	Ichanson, Locqueville
Wed	13.10.	Co:	Ekholm, Olander, Syväniemi
		Cu:	Kolawole, Nguyen, Munib
Fri	15.10.	In:	Kovanen, Ogunyemi
		Te:	Huhtakangas, Wallin, Kaarne
Mon	18.10.	Eu:	Sonphasit, Tuisku
		Nd:	Jussila, Siuro, Perttu
		U:	Sinkkonen, Wennberg, Partanen

QUESTIONS: Lecture 7

1. Among the following elements, select two, for which disproportionation reaction is not possible: K, Mn, Fe, Cu, Br, Cl, F, O. Explain why!
2. Below is the Latimer diagram for chromium in acidic conditions:

Draw the corresponding Frost diagram and answer to the following questions:

- What is the most stable oxidation state?
- For which oxidation states disproportionation tend to occur?

REDOX CHEMISTRY

- **Electron configuration**
- **Oxidation/valence states & ion charge**
- **Latimer diagram**
- **Frost diagram** **in SOLUTION**
- **Ellingham diagram (metal/oxide)**
- **Oxygen (non)stoichiometry**
- **Mixed valency** **in SOLID**
- **Disproportionation**
- **Valence separation**

Electron configurations of 3d metals: $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^x$

			3d				4s
Scandium (Sc)	↑						↑↓
Titanium (Ti)	↑	↑					↑↓
Vanadium (V)	↑	↑	↑				↑↓
Chromium (Cr)	↑	↑	↑	↑	↑		↑
Manganese (Mn)	↑	↑	↑	↑	↑		↑↓
Iron (Fe)	↑↓	↑	↑	↑	↑		↑↓
Koboltti (Co)	↑↓	↑↓	↑	↑	↑		↑↓
Nikkeli (Ni)	↑↓	↑↓	↑↓	↑	↑		↑↓
Kupari (Cu)	↑↓	↑↓	↑↓	↑↓	↑↓		↑
[Sinkki (Zn)]	↑↓	↑↓	↑↓	↑↓	↑↓		↑↓

Element							
Sc			+3				
Ti		+2	+3	+4			
V		+2	+3	+4	+5		
Cr		+2	+3	+4	+5	+6	
Mn		+2	+3	+4	+5	+6	+7
Fe		+2	+3	+4	+5	+6	
Co		+2	+3	+4	+5		
Ni		+2	+3	+4			
Cu	+1	+2	+3				
Zn		+2					

OXIDATION STATES

Figure 1. The 4th row of the periodic table. The transition metals are the elements that range from Sc (Scandium) to Zn (Zinc).

DISPROPORTIONATION

Redox reaction in which atoms of an element from one oxidation state are simultaneously oxidized and reduced.

Disproportionation of H_2O_2

www.adichemistry.com

Disproportionation of Cl_2 in cold dilute alkaline medium

www.adichemistry.com

MIXED VALENCY (mixed oxidation state)

- (1) the formal oxidation state for (at least) one of the elements is fractional**
- (2) (at least) one of the elements is at two different (integer) oxidation states**

CLASSIFICATION OF MIXED-VALENCE COMPOUNDS

M.B. Robin & P. Day, Adv. Inorg. Chem. Radiochem. 10, 247 (1967).

Class-I

- e.g. $\text{Na}_2\text{S}_2\text{O}_3$ (S^{II} & S^{VI})
- clearly **different environments** for the two different atoms
- large energy required for electron transfer between these atoms
→ **no interaction** → **no special properties**

Class-II

- e.g. Ag_2O_2 (Ag^{I} & Ag^{III})
- different but **sufficiently similar environments** → only a **small energy** required for electron transfer between the different atoms
→ **semiconducting**

Class-III

- e.g. Ag_2F ($\text{Ag}^{0.5}$) & $\text{YBa}_2\text{Cu}_3\text{O}_{7-\delta}$
- all mixed-valence atoms have **identical environments**
→ **electrons delocalized** → **metallic conductivity**

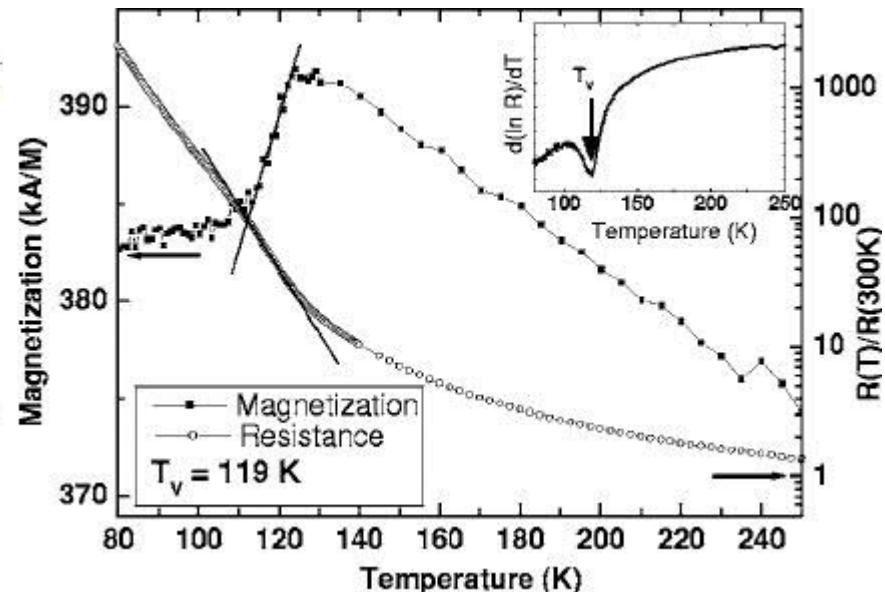

VALENCE SEPARATION (Verwey-type)

(mixed valence state) \rightarrow (valence-separated state)

Example: Magnetite Fe_3O_4 (

- Inverse spinel structure: $\text{tet}[\text{Fe}^{\text{III}}] \text{oct}[\text{Fe}^{2.5}]_2 \text{O}_4$
- Verwey transition (around 125 K): $2 \text{Fe}^{2.5} \rightarrow \text{Fe}^{\text{II}} + \text{Fe}^{\text{III}}$

Standard reduction potentials (E^0_{red})

Half Reaction	Standard Potential (V)
$\text{F}_2 + 2\text{e}^- \rightleftharpoons 2\text{F}^-$	+2.87
$\text{Pb}^{4+} + 2\text{e}^- \rightleftharpoons \text{Pb}^{2+}$	+1.67
$\text{Cl}_2 + 2\text{e}^- \rightleftharpoons 2\text{Cl}^-$	+1.36
$\text{O}_2 + 4\text{H}^+ + 4\text{e}^- \rightleftharpoons 2\text{H}_2\text{O}$	+1.23
$\text{Ag}^+ + 1\text{e}^- \rightleftharpoons \text{Ag}$	+0.80
$\text{Fe}^{3+} + 1\text{e}^- \rightleftharpoons \text{Fe}^{2+}$	+0.77
$\text{Cu}^{2+} + 2\text{e}^- \rightleftharpoons \text{Cu}$	+0.34
$2\text{H}^+ + 2\text{e}^- \rightleftharpoons \text{H}_2$	0.00
$\text{Pb}^{2+} + 2\text{e}^- \rightleftharpoons \text{Pb}$	-0.13
$\text{Fe}^{2+} + 2\text{e}^- \rightleftharpoons \text{Fe}$	-0.44
$\text{Zn}^{2+} + 2\text{e}^- \rightleftharpoons \text{Zn}$	-0.76
$\text{Al}^{3+} + 3\text{e}^- \rightleftharpoons \text{Al}$	-1.66
$\text{Mg}^{2+} + 2\text{e}^- \rightleftharpoons \text{Mg}$	-2.36
$\text{Li}^+ + 1\text{e}^- \rightleftharpoons \text{Li}$	-3.05

REDOX REACTIONS

- Separated into two half-reactions
- E^0 : standard electrode potential
 $[2\text{H}^+(\text{aq}) + 2\text{e}^- \rightarrow \text{H}_2(\text{g}); E^0 = 0.00 \text{ V}]$
- Nernst: $E = E^0 - \frac{RT}{nF} \times \ln \left[\frac{\text{prod}}{\text{react}} \right]$

- Gibbs free energy: $\Delta G^0 = -nFE^0$

- NOTE: E^0_{red} values are not directly additive, but ΔG^0 values are !!!**

R: Gas constant = $8.314 \text{ J} \cdot \text{mol}^{-1} \cdot \text{K}^{-1}$

F: Faraday constant (magnitude of electric charge per mole of electrons) = $96\,485 \text{ C mol}^{-1}$

Redox potentials may depend on pH STRONGLY !!!

LATIMER DIAGRAM

- Simple visual representation of the standard reduction potentials (E^0_{red}) between different oxidation states of an element
- Involves: metal, cations, oxo-ions, hydroxides & oxides
- OFTEN: Highest oxidation state is on the left, lowest on the right
- More positive $E^0_{\text{red}} \rightarrow$ more readily the species on the left is reduced to the species on the right

Disproportionation: EXAMPLE: oxygen

- H_2O_2 is readily reduced to H_2O
- H_2O_2 is NOT so readily oxidized to O_2
- However: $+1.78 \text{ V} > +0.68 \text{ V}$
- H_2O_2 disproportionates into oxygen and water:
 - in practice the reaction is slow without a catalyst

DISPROPORTIONATION:

chemical redox reaction where the same species (atom/ion/molecule) is simultaneously oxidized and reduced

Which manganese species tend to disproportionate ?

FROST DIAGRAM

- 2D version of the Latimer diagram
- The number of moving electrons is taken into account ($-n \times E^0_{\text{red}}$)
- x-axis: oxidation state
- y-axis: ΔG (in F)
- For pure metal: $y = 0$ V
- From the diagram we can see:
relative stabilities of the species with different oxidation states

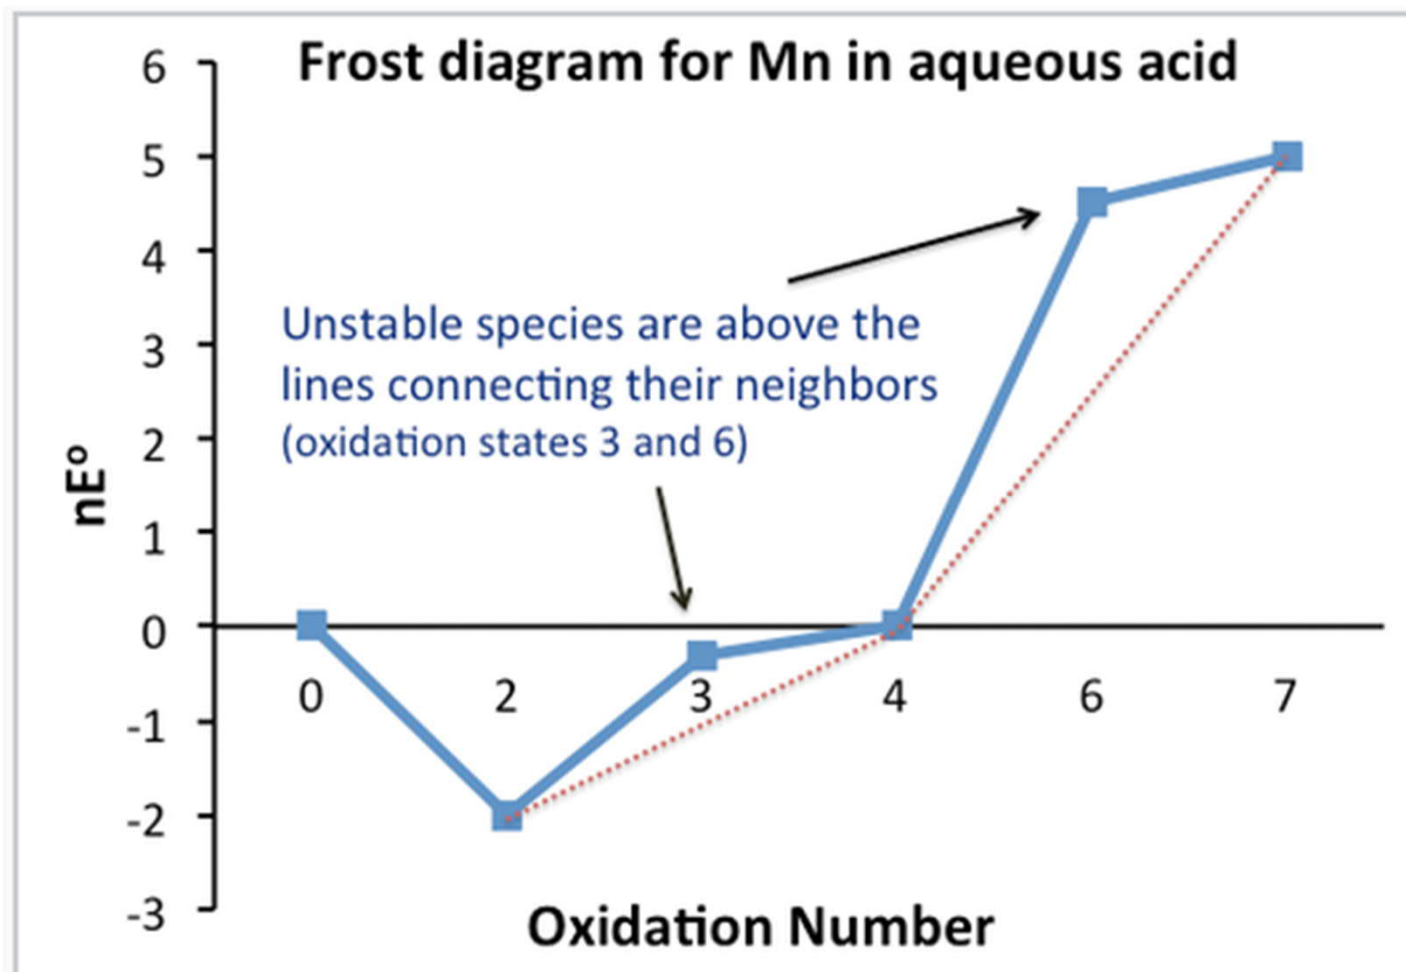

$$\text{Gibbs free energy: } \Delta G^0 = -nFE^0$$

Latimer diagram (acidic conditions)

Frost diagram for manganese

What can we see from the Frost diagram

- The lower the position of the species in the diagram is, the more stable (in terms of redox behavior) the species is
- A species that is on a convex (*kupera*) curve (compared to its neighbors) tends to disproportionate
- A species that is on a concave (*kovera*) curve (compared to its neighbors) does not disproportionate

Frost diagram for manganese

Manganese (acidic cond)

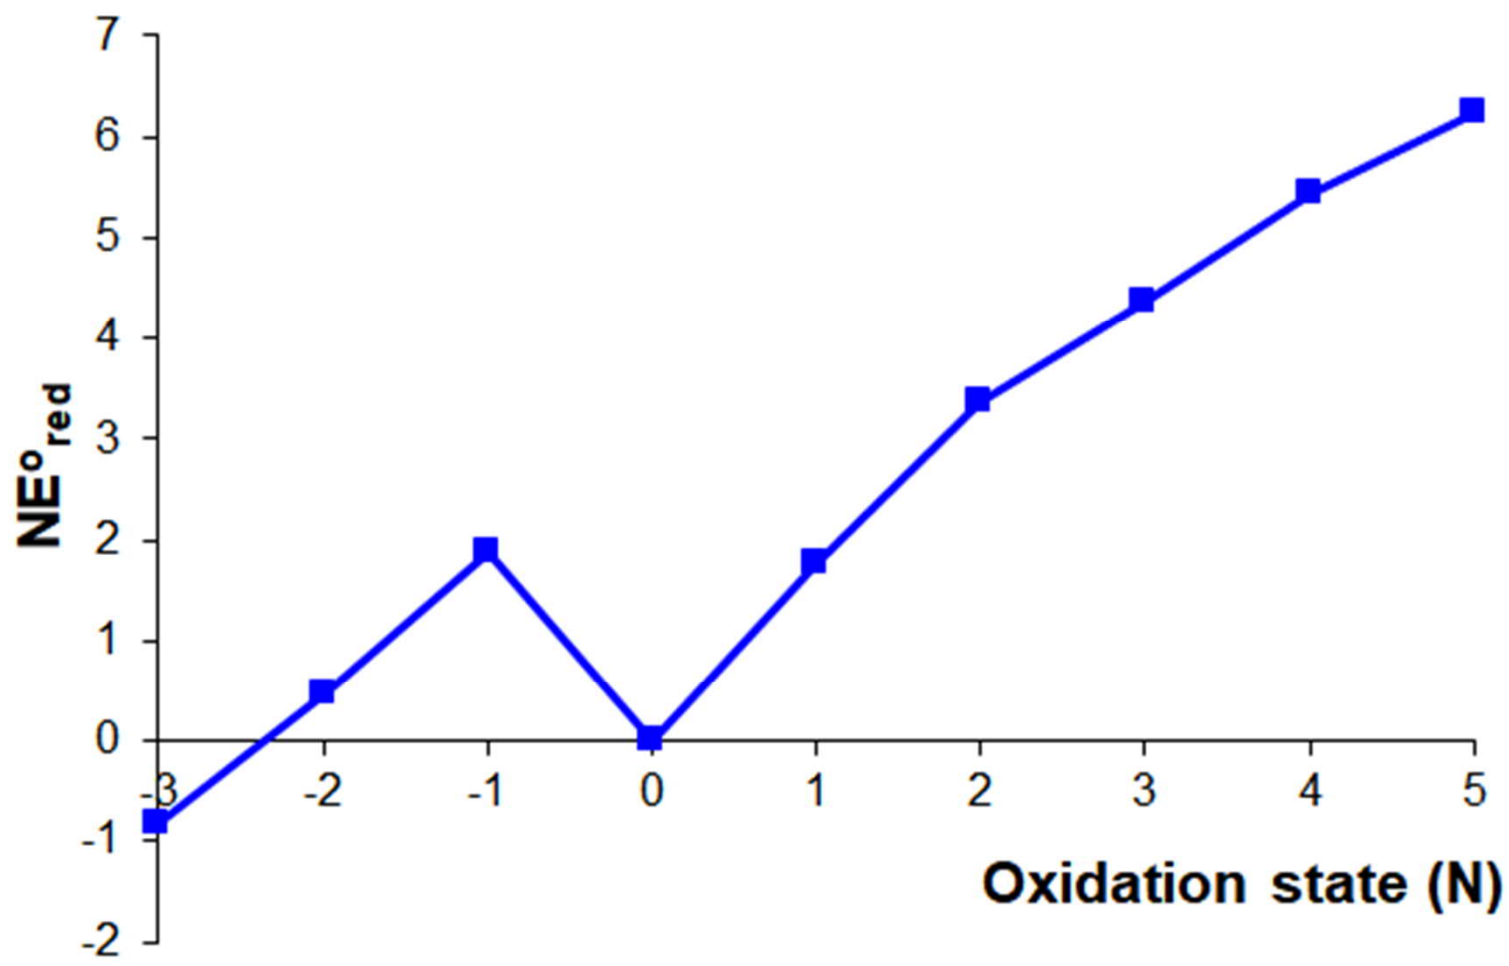

- Mn²⁺: most stable
- MnO₄⁻: strong oxidizer
- Mn³⁺ and MnO₄³⁻ tend to disproportionate
- MnO₂: does not disproportionate
- NOTE: According to thermodynamics MnO₄⁻ should be reduced to Mn²⁺; this reaction is however slow without catalyst, explaining why MnO₄⁻ solutions can be stored in laboratory

RUTHENIUM Ru

FROST DIAGRAMS

Element	Symbol	Electronic Configuration
Scandium	Sc	$[Ar]3d^14s^2$
Titanium	Ti	$[Ar]3d^24s^2$
Vanadium	V	$[Ar]3d^34s^2$
Chromium	Cr	$[Ar]3d^54s^1$
Manganese	Mn	$[Ar]3d^54s^2$
Iron	Fe	$[Ar]3d^64s^2$
Cobalt	Co	$[Ar]3d^74s^2$
Nickel	Ni	$[Ar]3d^84s^2$
Copper	Cu	$[Ar]3d^{10}4s^1$
Zinc	Zn	$[Ar]3d^{10}4s^2$

Element						
Sc			+3			
Ti	+2	+3	+4			
V	+2	+3	+4	+5		
Cr	+2	+3	+4	+5	+6	
Mn	+2	+3	+4	+5	+6	+7
Fe	+2	+3	+4	+5	+6	
Co	+2	+3	+4	+5		
Ni	+2	+3	+4			
Cu	+1	+2	+3			
Zn		+2				

OXIDATION STATES (slightly depending on conditions !)

Figure 1. The 4th row of the periodic table. The transition metals are the elements that range from Sc (Scandium) to Zn (Zinc).

Ellingham diagram

- Gibb's free energy of formation versus temperature for metal oxides
- Temperature at which a metal oxide is spontaneously (ΔG^0 becomes positive) reduced to a metal

Above 900 $^\circ\text{C}$ ZnO can be reduced to Zn by carbon

2B(1) Standard Free Energy of Formation of Oxides

Oxygen Release

Ag_2O_2 :
in two discrete steps

Oxygen Engineering !

$\text{YBa}_2\text{Cu}_3\text{O}_{7-\delta}$:
Gradually \rightarrow mixed-valent Cu

OXYGEN-DEFICIENT SAMPLES

OXYGEN NONSTOICHIOMETRY

(1) Oxygen vacancies

(2) Interstitial oxygen atoms

(3) Cation vacancies

(4) Interstitial cations
