

The future of delivery solutions in and between buildings

Material flows are a significant part of everyday urban mobility and life in cities. Digitalization, has led to an increasing need for new kinds of delivery services. Simultaneously, due to corona, there is a need for delivering different goods even without human contact. Yet in a secure and safe way.

KONE's mission is to improve the flow of urban life. Now we need your help in ideating the future of delivery solutions in and between buildings. *What kind of delivery services are needed by future citizens? What would a future sustainable delivery solution look like?*

We expect the team to come up with a novel delivery solution that is based on an identified end user need. The solution should also consider resilience in times of crisis. In the end, we hope to see a brave concept for a future delivery solution, that is desirable, feasible and viable, while not compromising the planetary boundaries.
