

Burger preparation automation with **Naughty** robotics!

Naughty BRGR is a trendy and tasty Finnish fast casual food restaurant and retail chain. Our ambition is to be the industry innovation leader in Europe by transforming our business with digital solutions, robotics and AI.

We are looking for a motivated team to automate the burger preparation process with the help of robotics and machinery. Currently, all of our burgers are 100% handmade. The naughty burger robot might automate the whole process, parts of the process or transform the whole way of buying, making and delivering burgers. It may range from being a kitchen assistant to replacing the whole kitchen as a “stand-alone mobile order and pick-up -vending machine”. It could be designed just for kitchen use or be a compact device that could serve customers even on an airplane. It might produce just one type of burger or let our customers tailor every detail of their preference. Following food safety and hygiene standards have to be ensured.

The main goal is to automate work, produce food of consistent quality significantly faster than today, improve production scalability and represent the future of fast casual food production. And, of course this robot should have a rather cool – and naughty – design!
