

SCARECROW Industry 4.0

Birds, deers and other animals cause a lot of harm for farmers and gardens. The problem with passive scarecrows is that the fear effect only lasts for a limited time, and the same applies to more active methods respectively. The objective is to design concepts for an affordable and efficient scarecrow that applies modern technology, and is safe for both users and animals. The most promising concept(s) should be prototyped and tested during the spring.

There are no particular 'requirements' for the Team – just the passion to get familiar with farming, the problem, existing solutions and the practical limitations and possibilities in farming and gardening. According to the concept of PDP a lot of concept generation, testing, prototyping and playing with technologies is very welcome.
