Lecture 11: Sensorless Synchronous Motor Drives ELEC-E8402 Control of Electric Drives and Power Converters

Marko Hinkkanen

Spring 2021

Learning Outcomes

After this lecture and exercises you will be able to:

- Explain the voltage-model estimator
- Explain the basic principles of high-frequency signal-injection methods

Rotor-Position Estimation Methods

- Fundamental-excitation-based methods¹
 - Rely on the mathematical model of the motor
 - Voltage model, observers
 - Sensitive to parameter errors at low speeds
 - Risk of unstable regions also at high speeds if the gains are not properly chosen
- ► High-frequency signal-injection methods^{2,3}
 - Aim to enable sensorless operation at very low speeds
 - ▶ Rely on magnetic saliency, $L_d \neq L_q$ is necessary
 - Pulsating or rotating excitation signal
 - Dynamic performance may be poor
 - Cause additional losses and noise
 - Often combined with a fundamental-excitation-based method

Speed-Adaptive Observer

Observer With High-Frequency Signal Injection

Typical Sensorless Control System

Reference calculation remains the same as in sensored drives

Observer could alternatively be implemented in stator coordinates

⁴Holtz, "Pulsewidth modulation for electronic power conversion," Proc. IEEE, 1994.

Voltage Model in Stator Coordinates

Stator flux estimator

$$\begin{split} \frac{\mathrm{d}\hat{\underline{\psi}}_{\mathrm{s}}^{\mathrm{s}}}{\mathrm{d}t} &= \underline{u}_{\mathrm{s}}^{\mathrm{s}} - \hat{R}_{\mathrm{s}}\underline{i}_{\mathrm{s}}^{\mathrm{s}} \quad \Rightarrow \\ \underline{\hat{\psi}}_{\mathrm{s}}^{\mathrm{s}} &= \int (\underline{u}_{\mathrm{s}}^{\mathrm{s}} - \hat{R}_{\mathrm{s}}\underline{i}_{\mathrm{s}}^{\mathrm{s}}) \mathrm{d}t \end{split}$$

Flux estimate

$$\underline{\hat{\psi}}_{s}^{s} = \hat{\psi}_{\alpha} + j\hat{\psi}_{\beta} = \hat{\psi}_{s}e^{j\hat{\vartheta}}$$

Flux angle estimate

$$\hat{artheta}=$$
atan2 $\left(\hat{\psi}_{eta},\hat{\psi}_{lpha}
ight)$

Rotor speed in steady state

$$\hat{\omega}_{\rm m} = \frac{{\rm d}\hat{\vartheta}}{{\rm d}t}$$

► Rotor angle ŷ_m should still be solved from flux equations

Properties of the Voltage Model

- Estimation-error dynamics are marginally stable (pure integration)
- Flux estimate will drift away from the origin due to any offsets in measurements
- \blacktriangleright Very sensitive to $\hat{R}_{\rm s}$ and inverter nonlinearities at low speeds
- Good accuracy at higher speeds despite the parameter errors (but pure integration has been remedied)
- Can be improved with suitable feedback \Rightarrow observer
- Can be implemented in estimated rotor coordinates

Real-Time Simulation of Motor Equations

 State estimator in estimated rotor coordinates

$$\frac{\mathrm{d}\hat{\underline{\psi}}_{\mathrm{s}}}{\mathrm{d}t} = \underline{u}_{\mathrm{s}} - \hat{R}_{\mathrm{s}}\hat{\underline{i}}_{\mathrm{s}} - \mathrm{j}\hat{\boldsymbol{\omega}}_{\mathrm{m}}\hat{\underline{\psi}}_{\mathrm{s}}$$

where the current estimate is

$$\underline{\hat{i}}_{\rm s} = \hat{i}_{\rm d} + \mathbf{j}\hat{i}_{\rm q}$$

with the components

$$\begin{split} \hat{i}_{\rm d} &= (\hat{\psi}_{\rm d} - \hat{\psi}_{\rm F}) / \hat{L}_{\rm d} \\ \hat{i}_{\rm q} &= \hat{\psi}_{\rm q} / \hat{L}_{\rm q} \end{split}$$

Rotor position estimator

$$\frac{\mathrm{d}\hat{\vartheta}_{\mathrm{m}}}{\mathrm{d}t} = \hat{\omega}_{\mathrm{m}}$$

- How to obtain the speed estimate?
- Could we improve this open-loop flux estimator?

Speed-Adaptive Observer

State observer

$$\begin{aligned} \frac{\mathrm{d}\hat{\psi}_{\mathrm{s}}}{\mathrm{d}t} &= \underline{u}_{\mathrm{s}} - \hat{R}_{\mathrm{s}}\hat{\underline{i}}_{\mathrm{s}} - \mathrm{j}\hat{\omega}_{\mathrm{m}}\hat{\underline{\psi}}_{\mathrm{s}} \\ &+ \underline{k}_{1}(i_{\mathrm{d}} - \hat{i}_{\mathrm{d}}) + \underline{k}_{2}(i_{\mathrm{q}} - \hat{i}_{\mathrm{q}}) \end{aligned}$$

where the current estimate is

$$\underline{\hat{i}}_{\rm s} = \hat{i}_{\rm d} + \mathbf{j}\hat{i}_{\rm q}$$

with the components

$$\hat{i}_{\mathrm{d}} = (\hat{\psi}_{\mathrm{d}} - \hat{\psi}_{\mathrm{F}})/\hat{L}_{\mathrm{d}}$$

 $\hat{i}_{\mathrm{q}} = \hat{\psi}_{\mathrm{q}}/\hat{L}_{\mathrm{q}}$

Rotor position estimator

$$\frac{\mathrm{d}\hat{\vartheta}_{\mathrm{m}}}{\mathrm{d}t} = \hat{\omega}_{\mathrm{m}}$$

Speed estimation

$$\hat{\omega}_{\mathrm{m}} = k_{\mathrm{p}}(i_{\mathrm{q}}-\hat{i}_{\mathrm{q}}) + k_{\mathrm{i}}\int(i_{\mathrm{q}}-\hat{i}_{\mathrm{q}})\mathrm{d}t$$

drives $i_{\mathrm{q}} - \hat{i}_{\mathrm{q}}$ to zero

 Also the d-component could be used for speed estimation

- Constant observer gains $\underline{k}_1 = g\hat{L}_d$ and $\underline{k}_2 = g\hat{L}_q$ work quite well (typically $g = 2\pi \cdot 15 \dots 30$ rad/s can be chosen)⁵
- However, interaction between the state observer and the speed estimation may lead to unstable regions⁶
- Stabilizing observer gains <u>k</u>₁ and <u>k</u>₂ decouple two subsystems and enable pole placement
- ► 6.7-kW SyRM is used as example in the following

⁵Capecchi, Guglielmi, *et al.*, "Position-sensorless control of the transverse-laminated synchronous reluctance motor," *IEEE Trans. Ind. Appl.*, 2001. ⁶Hinkkanen, Saarakkala, *et al.*, "Observers for sensorless synchronous motor drives: Framework for design and analysis," *IEEE Trans. Ind. Appl.*, 2018.

Observer Poles at the Maximum Torque

Stabilizing observer gain⁶

Experimental Results: Acceleration at the Maximum Torque

Stabilizing observer gain⁶

Speed-Adaptive Observer

Observer With High-Frequency Signal Injection

Signal Injection Utilizes the Magnetic Saliency

Sensorless Control Augmented With Signal Injection⁷

⁷ Piippo, Hinkkanen, and Luomi, "Analysis of an adaptive observer for sensorless control of interior permanent magnet synchronous motors," *IEEE Trans. Ind. Appl.*, 2008.

Position Estimation Error

- Controller operates in estimated rotor coordinates (no superscript)
- Actual rotor coordinates are marked with the superscript r
- Some estimation error exists

$$\tilde{\vartheta}_{\rm m} = \vartheta_{\rm m} - \hat{\vartheta}_{\rm m}$$

This leads to control errors

$$\begin{split} \underline{i}_{s}^{r} &= \underline{i}_{s} \, e^{-j \tilde{\vartheta}_{m}} \\ \underline{\psi}_{s}^{r} &= \underline{\psi}_{s} \, e^{-j \tilde{\vartheta}_{m}} \end{split}$$

Excitation Voltage and Resulting Current Response

- Subscript i refers to injected high-frequency signals
- ► High-frequency excitation

 $\underline{u}_{\rm si} = u_{\rm i}\cos(\omega_{\rm i}t)$

injected on the d-axis

 Resulting stator flux linkage in estimated rotor coordinates

$$\underline{\psi}_{\rm si} = \int \underline{u}_{\rm si} \mathrm{d}t = \frac{u_{\rm i}}{\omega_{\rm i}} \sin(\omega_{\rm i} t)$$

assuming
$$R_{\rm s}=0$$
 and $\omega_{\rm m}=0$

Stator flux linkage in rotor coordinates

$$\begin{split} \underline{\psi}_{\mathrm{si}}^{\mathrm{r}} &= \psi_{\mathrm{di}}^{\mathrm{r}} + \mathrm{j}\psi_{\mathrm{qi}}^{\mathrm{r}} = \underline{\psi}_{\mathrm{si}} \,\mathrm{e}^{-\mathrm{j}\tilde{\vartheta}_{\mathrm{m}}} \\ &= \frac{u_{\mathrm{i}}}{\omega_{\mathrm{i}}} \sin(\omega_{\mathrm{i}}t) \left(\cos\tilde{\vartheta}_{\mathrm{m}} - \mathrm{j}\sin\tilde{\vartheta}_{\mathrm{m}}\right) \end{split}$$

 Resulting high-frequency current response in estimated rotor coordinates

$$\begin{split} \underline{i}_{\rm si} &= i_{\rm di} + j i_{\rm qi} = \underline{i}_{\rm si}^{\rm r} {\rm e}^{{\rm j}\tilde\vartheta_{\rm m}} \\ &= \left(\frac{\psi_{\rm di}^{\rm r}}{L_{\rm d}} + {\rm j}\frac{\psi_{\rm qi}^{\rm r}}{L_{\rm q}}\right) \left(\cos\tilde\vartheta_{\rm m} + {\rm j}\sin\tilde\vartheta_{\rm m}\right) \end{split}$$

where $\psi^{\rm r}_{\rm di}$ and $\psi^{\rm r}_{\rm qi}$ are obtained from the previous equation

Note that $\psi_{\rm F}$ does not affect the high-frequency current response since it is constant.

 Component in the estimated q-direction

$$i_{\mathrm{qi}} = rac{u_{\mathrm{i}}}{2\omega_{\mathrm{i}}} rac{L_{\mathrm{q}} - L_{\mathrm{d}}}{L_{\mathrm{d}}L_{\mathrm{q}}} \sin(\omega_{\mathrm{i}}t) \sin(2\tilde{\vartheta}_{\mathrm{m}})$$

is an amplitude modulation of the carrier by the envelope $\sin(2\tilde{\vartheta}_m)$

Demodulation

$$i_{qi}\sin(\omega_{i}t) = \frac{u_{i}}{4\omega_{i}} \frac{L_{q} - L_{d}}{L_{d}L_{q}} [1 - \sin(2\omega_{i}t)]\sin(2\tilde{\vartheta}_{m})$$

Low-pass filtering

$$\begin{aligned} \epsilon &= \mathsf{LPF}\left\{i_{\mathrm{qi}}\sin(\omega_{\mathrm{i}}t)\right\} \\ &= \frac{u_{\mathrm{i}}}{4\omega_{\mathrm{i}}}\frac{L_{\mathrm{q}}-L_{\mathrm{d}}}{L_{\mathrm{d}}L_{\mathrm{q}}}\sin(2\tilde{\vartheta}_{\mathrm{m}})\end{aligned}$$

Error signal ϵ is roughly proportional to the position estimation error $\tilde{\vartheta}_m$

Observer Augmented With Signal Injection

$$\boldsymbol{\epsilon} = \mathsf{LPF}\left\{i_{\mathrm{q}}\sin(\omega_{\mathrm{i}}t)
ight\} pprox rac{u_{\mathrm{i}}}{2\omega_{\mathrm{i}}}rac{L_{\mathrm{q}}-L_{\mathrm{d}}}{L_{\mathrm{d}}L_{\mathrm{q}}} ilde{artheta}_{\mathrm{m}}$$

Error-signal calculation (delay and cross-saturation compensations are omitted in the figure for simplicity)

LPF

 $\sin(\omega_{\rm i} t)$

lmł

Observer augmented with error signal

Experimental Results: Torque Steps at Zero Speed⁸

- ► 6.7-kW SyRM drive
- Sustained zero-speed operation (under load torque) possible due to signal injection

⁸Tuovinen and Hinkkanen, "Adaptive full-order observer with high-frequency signal injection for synchronous reluctance motor drives," *IEEE J. Emerg. Sel. Topics Power Electron.*, 2014.

Sensorless Control: Problems and Properties

Sources of errors in the position estimation

- Parameter errors: \hat{R}_{s} is important at low speeds
- Accuracy of the stator voltage (inverter nonlinearities)
- Cross-saturation causes position error in signal injection
- Sustained operation at zero speed (under the load torque) is not possible without signal injection
- Most demanding applications still need a speed or position sensor

Other Control Challenges

- High saliency ratio and low (or zero) PM flux
- High stator frequency, increasing sensitivity to
 - Time delays
 - Discretization
- Parameter variations and inaccuracies
 - Magnetic saturation, core losses
 - Stator resistance and PM flux (temperature)
 - Skin effect (in form-wounded stator windings)
- Identification of the motor parameters
 - Self-commissioning during the drive start-up
 - ► Finite-element analysis?
 - Role of IoT and machine learning in the future?
