

VTT

Metabolic modelling in synthetic biology

Paula Jouhten
VTT Technical Research
Centre of Finland Ltd

This lecture will introduce

1. Metabolic phenotype prediction and estimation using genome-scale metabolic models
2. Design of synthetic metabolic pathways
3. Design of engineering strategies for optimizing production

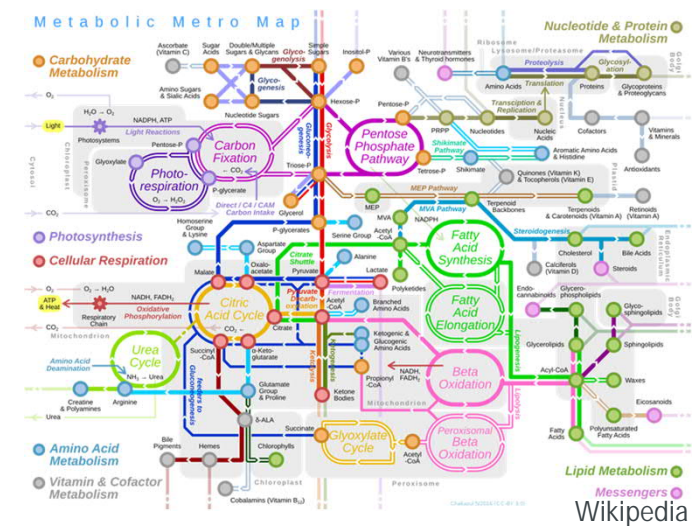

1. Metabolic phenotype prediction and estimation using genome-scale metabolic models

Why is metabolism relevant for synthetic biology?

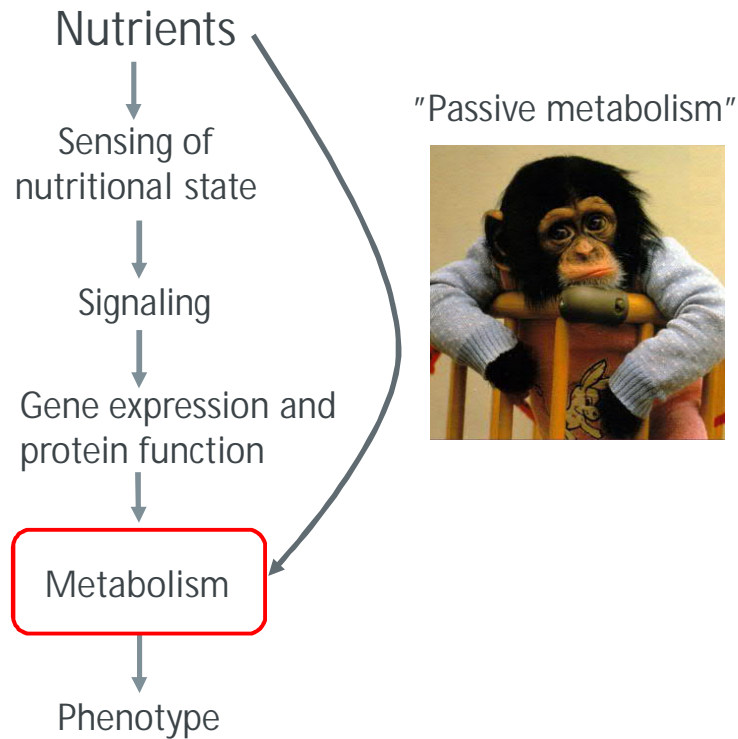

Metabolism = (bio)chemical reactions involved in sustaining a living state of cells and an organism

- Metabolism generates precursors for product compounds but also for circuit components
- Metabolism generates energy and redox power
- Metabolism is involved in the regulation of cells

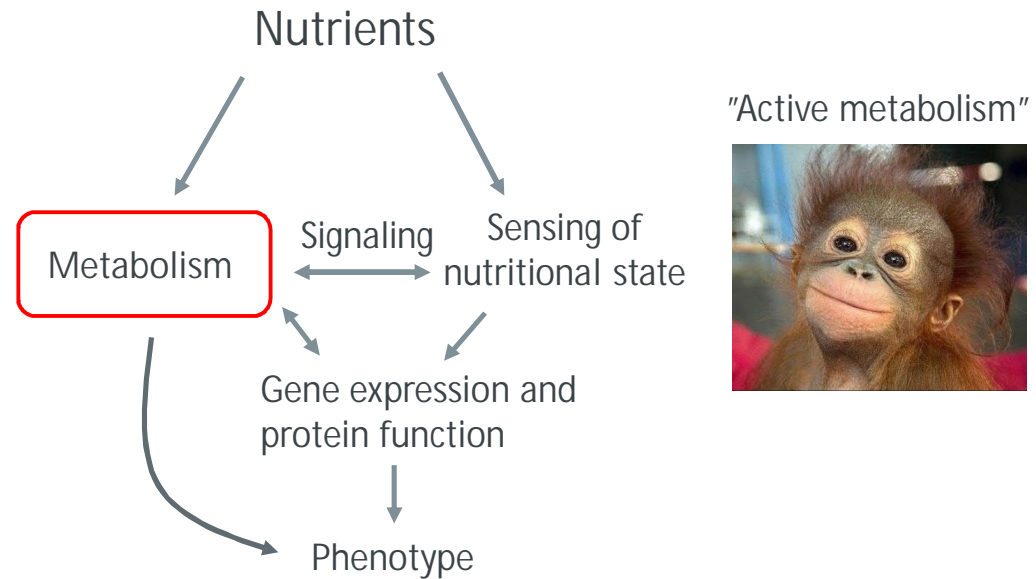

Active metabolism

Conventional view

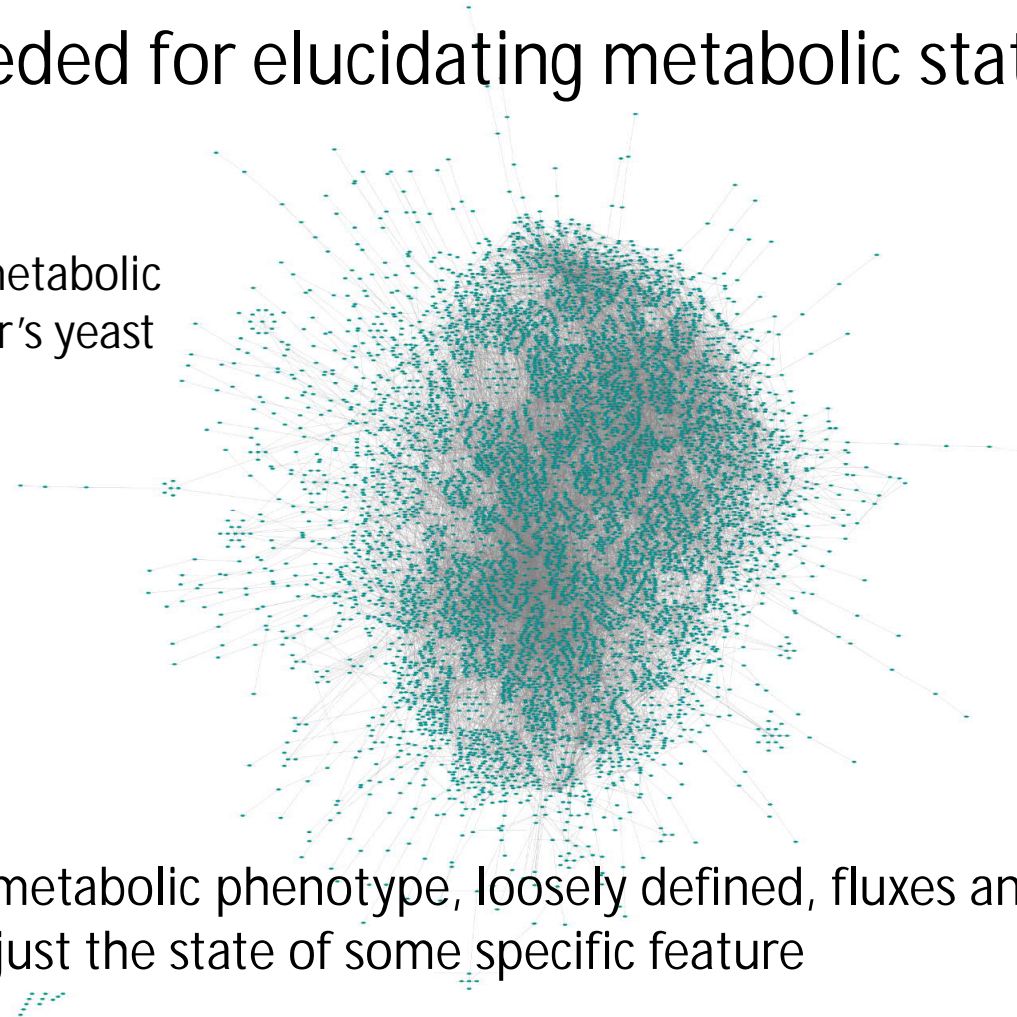

Current understanding

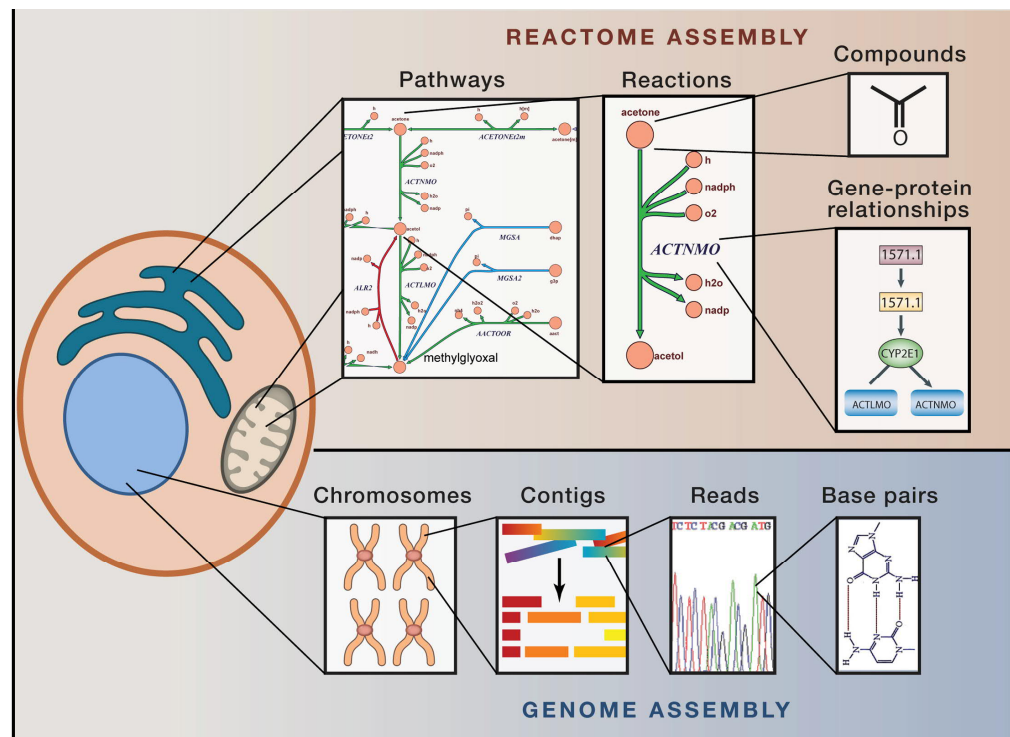

Modelling needed for elucidating metabolic states

Genome-scale metabolic network of Baker's yeast

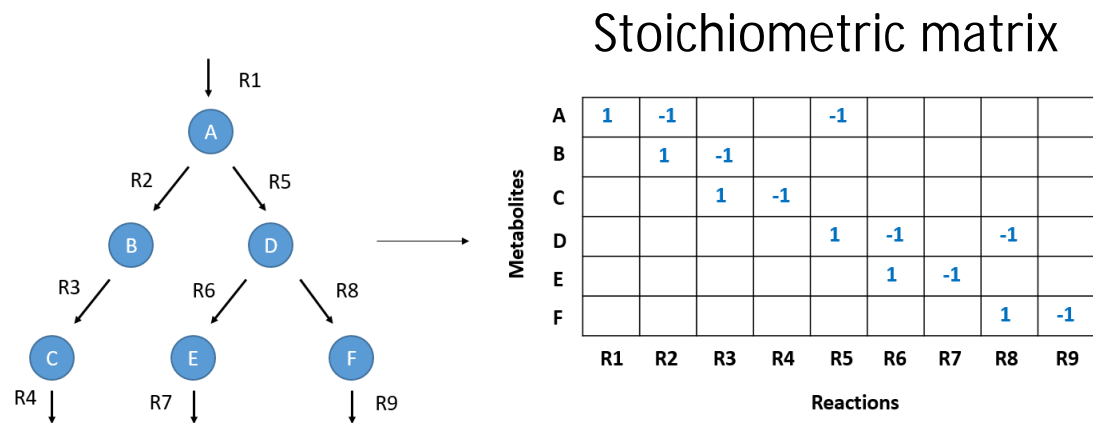

Metabolic state = metabolic phenotype, loosely defined, fluxes and metabolite concentrations or just the state of some specific feature

Assembly of genome-wide metabolism

Conversion to a mathematical representation

Obeying the law of conservation of mass,
metabolite mass balances constrain metabolic phenotypes

$$\frac{dX}{dt} = S \cdot v = S \cdot f(e(t), s(t), p) \quad (\text{Equation 1})$$

Figure modified by
Tuula Tenkanen from
O'Brien et al. 2015

Steady state assumption linearizes the mass balances

$$\frac{dX}{dt} = \mathbf{S} \cdot \mathbf{v} = \mathbf{S} \cdot \mathbf{f}(\mathbf{e}(t), \mathbf{s}(t), \mathbf{p}) = 0 \quad (\text{Equation 2})$$

Constraints:

- 1) $\mathbf{S}\mathbf{v} = 0$
- 2) $\mathbf{v}, lb < \mathbf{v} < \mathbf{v}, ub$

Figure modified by
Tuula Tenkanen from
O'Brien et al. 2015

The linear system is lighter to solve and free of kinetic equations and parameters
Additional constraints introduced to obey the second law of thermodynamics

Linear optimization can be used to identify optimal metabolic states

Figure modified by Tuula Tenkanen from O'Brien et al. 2015

Flux Balance Analysis (FBA)

Varma and Palsson, 1993; Varma and Palsson, 1994

maximize (or minimize) $c' \cdot v$

subject to

$$S \cdot v = 0 \quad (\text{Equation 3})$$

$$v, lb < v < v, ub$$

Task:

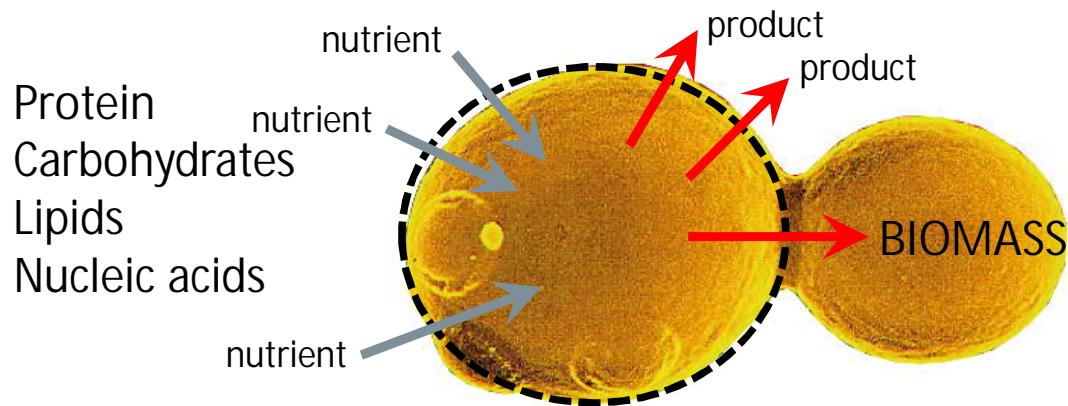

What are the benefits arising from the steady state assumption?

- a) kinetic parameters are not needed
- b) linear problems are easier to solve
- c) metabolism is not dynamic
- d) metabolite concentrations are not variables

Artificial reaction(s) forming biomass allows growth simulations

What should the artificial biomass reaction(s) include?

- Proportions and exact compositions are species, strain, and condition dependent
- Biomass equation commonly describes the energy and redox balancing requirements of synthesizing macromolecules
- Dilution of other intracellular metabolites due to cell division is neglectable and omitted in simulations

Universally Essential Cofactors in Prokaryotes Xavier JC et al. (2017) Metab Eng.

Organic cofactor(s)	BOFs of manually-curated GEIMs (1)	A. Biosynthesis genes are essential (2)	B. Participates in essential reactions (3)	C. Reviewed Evidence		Essentiality	Functional role
				ModelSEED (4)	Literature (5)		
NAD(H)	■	■	■	■	■	Universal	Transport and transfer of hydride groups.
NADP(H)	■	■	■	■	■	Universal	Transport and transfer of hydride groups.
S-adenosyl-methionine	■	■	■	■	■	Universal	Universal methyl donor; generator of deoxyadenosyl radicals.
FAD	■	■	■	■	■	Universal	Electron transfer, radical and photoreceptor-induced reactions.
Pyridoxal Sp	■	■	■	■	■	Universal	Electrophilic catalyst
Coenzyme A	■	■	■	■	■	Universal	Transport and transfer of acyl groups
C1 carriers (derivatives of H(4)-MPT or H(4)folate)	■	■	■	■	■	Universal	Transport and donation of C1 units
Thiamin diphosphate	■	■	■	■	■	Universal	Making and breaking bonds between C and S, O, H and N atoms, and most notably C-C bonds
FMN	■	■	■	■	■	Universal	Electron transfer, radical and photoreceptor-induced reactions.

Task:

How is microbial growth described in genome-scale metabolic models?

- a) number of cells increase
- b) biomass is a product as any other compound produced out of the cells
- c) energy and redox costs of growth predicted using model simulations

Metabolic states depend on environment

Specific fluxes

Flux units mmol/(g CDW h)

Since the artificial biomass reaction is defined as mmoles of precursors for 1 g CDW

Prediction vs estimation of metabolic state?

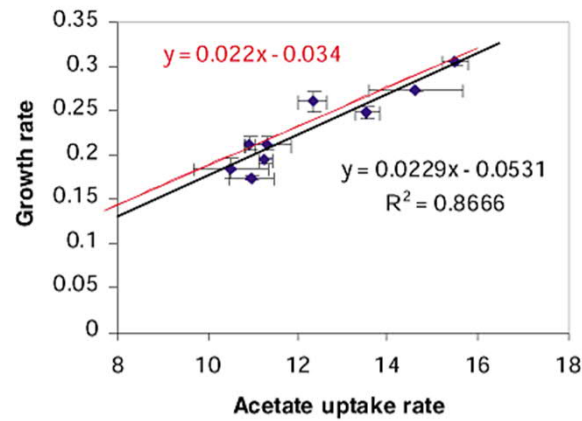

When arbitrary constraints are used, yields can be predicted
When empirical rates are used as constraints, other rates can be estimated or predicted

Task:

How is growth environment considered in the genome-scale metabolic model simulations?

- a) it is described in the manuscript
- b) it is encoded in the exchange flux bounds
- c) if experimental uptake rates are known, fluxes can be estimated
- d) if experimental uptake rates are not known, nothing can be predicted

FBA simulations optimizing growth predict well experimental phenotypes

Eukaryotic metabolism is compartmentalized

Novel CarveFungi for eukaryotic model reconstruction by predicting enzyme subcellular localizations

~ 5000 reactions

Unpublished work

Task:

Why is model reconstruction more challenging for eukaryotic than for prokaryotic species?

- a) it cannot be done top-down
- b) subcellular compartment membranes are not permeable to many compounds
- c) enzyme subcellular localization varies between species

Metabolic reaction databases

<https://www.genome.jp/kegg/>

<https://www.rhea-db.org/>

<https://metacyc.org/>

<https://www.metanetx.org/>

Task: Which reactions are needed to convert 3,4-dihydroxybenzoate to cis,cis-muconate? What are the proteins (uniprot entries) that could be used?

<https://www.genome.jp/kegg/>

<https://www.rhea-db.org/>

<https://metacyc.org/>

<https://www.metanetx.org/>

Protein database: <https://www.uniprot.org/>

Enzymes may be promiscuous

- Enzymes may catalyze alternative reactions

- catalytic promiscuity = "ability of an enzyme to catalyze a secondary reaction at the same active site where its primary activity occurs, and the secondary activity has a different mechanism"
- substrate promiscuity = substrate ambiguity

Reactions catalyzed by
KDG aldolase from
Sulfolobus solfataricus

<http://www.jbc.org/content/279/42/43886.full.html>
<http://www.jbc.org/content/285/44/33701.long>

Example of catalytic promiscuity: 4-Oxalocrotonate Tautomerase

Primary reaction

2-hydroxy-2,4-hexadienedioate

2-oxo-3-hexenedioate

<https://chemistry-europe.onlinelibrary.wiley.com/doi/full/10.1002/cbic.201000633>

Secondary reaction: aldol condensation

acetaldehyde benzaldehyde

cinnamaldehyde

Reaction rules model possible enzyme catalyzed reactions

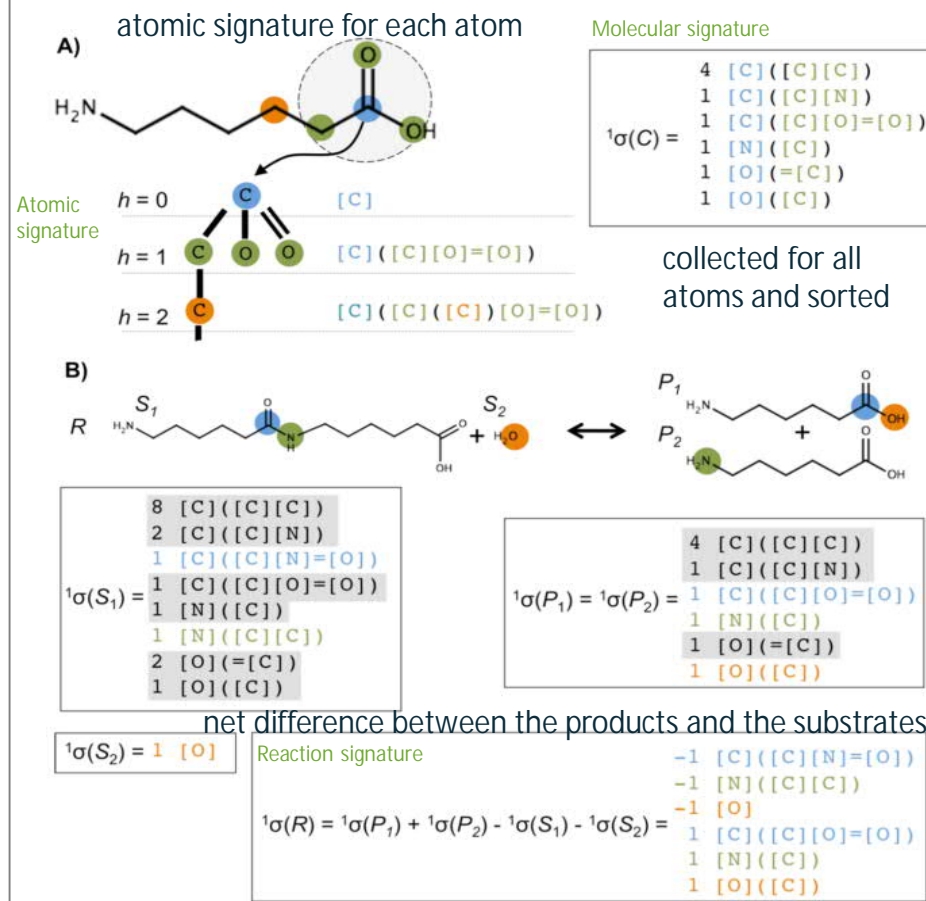

- Rules model similarities to known reactions (i.e. similarities of reactants)
- Assume that if the core of the reaction (where the bonds break) remains the same then an enzyme could be found/built for the novel reaction
- Define different dimensions of the core
- Reaction rules create extended metabolic space

Table 1 Reactions in the EMRS

height h	reactions	% increase from canonical
2	9083	17.72%
3	7882	2.15%
4	7800	1.09%
5	7752	0.47%
6	7725	0.12%
canonical	7716	0%

Number of novel generated putative reactions in the EMRS for different heights h .

Retropath method reaction signature

Carbonell, P., Planson, A.-G., Fichera, D., & Faulon, J.-L. (2011). A retrosynthetic biology approach to metabolic pathway design for therapeutic production. *BMC Systems Biology*, 5(1), 122.

Task:

If the reaction rules are used to create extended metabolic space it becomes larger when..?

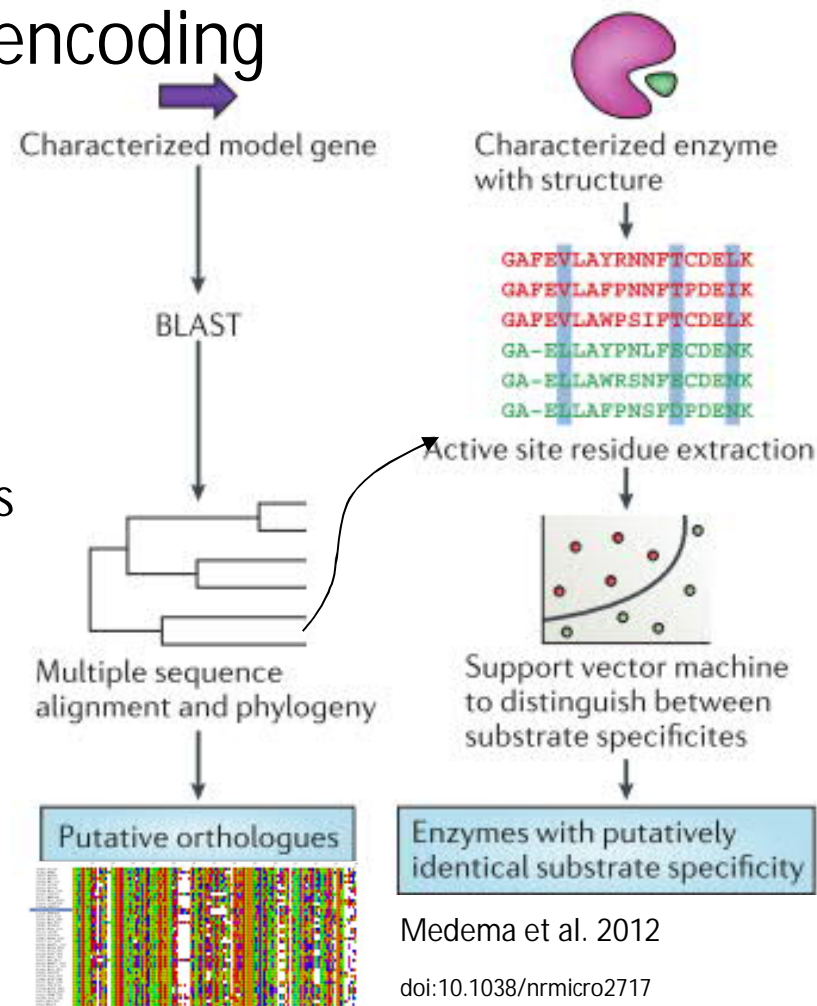

- a) dimension parameter is smaller
- b) dimension parameter is bigger

Selecting candidate enzyme encoding sequences

- Gene/protein databases include references to enzyme mechanisms (e.g. EC numbers)
- Further candidates (orthologs) by genome mining of sequence databases
- Screening candidates' performances

Orthologs: genes in different species evolved from a common ancestral gene.

Paralogs: gene copies created by a duplication event within the same genome.

Medema et al. 2012

doi:10.1038/nrmicro2717

Slide adopted from Merja Oja

Synthetic pathway to pinocembrin to *E.coli*

Alternative enzyme options result in different pinocembrin titers
 Pathway optimization could involve optimizing the enzyme levels or the actual enzymes

Novel machine learning approaches reach beyond homology based enzyme finding

Public and proprietary sequence resources in use

M. Ilmén *et al.*, *Metab. Eng.*, 2015; M. Oja *et al.*, *ISMB Comm J*, 2017

Challenge

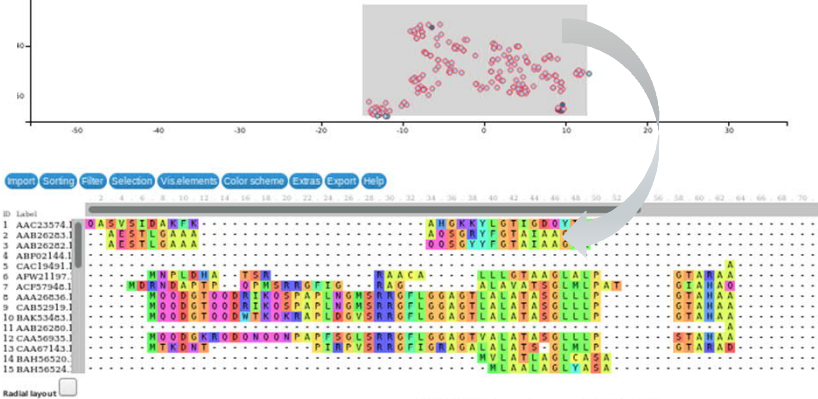

- Interesting enzymes may lack homology to known genes
- How should novel enzyme sequences be?

Our strategy

- Complementing conventional sequence mining with machine learning

Homology based search of isoprene synthases

Frances H. Arnold
received the Noble prize
for directed evolution of
proteins in 2018

<https://www.quantamagazine.org/frances-arnold-george-smith-and-gregory-winter-win-chemistry-nobel-for-directing-evolution-20181003/>

THE WORK FLOW FOR THE DIRECTED EVOLUTION OF ENZYMES

1 Random mutations are introduced in the gene for the enzyme that will be changed.

2 The genes are inserted in bacteria, which use them as templates and produce randomly mutated enzymes.

3 The changed enzymes are tested. Those that are most efficient at catalysing the desired chemical reaction are selected.

4 New random mutations are introduced in the genes for the selected enzymes. The cycle begins again.

©Johan Jarnestad/The Royal Swedish Academy of Sciences

Task: Find out who are DeepMind and what was the breakthrough they demonstrated in 2020 – Let's discuss this tomorrow

Criteria for choosing pathways for experimental implementation?

- Yield
- Thermodynamics
- Pathway length
- Number of new-to-nature reactions
- Possible host
- Toxicity

Tasks:

How do you get the theoretical yield of the target compound for a candidate pathway?

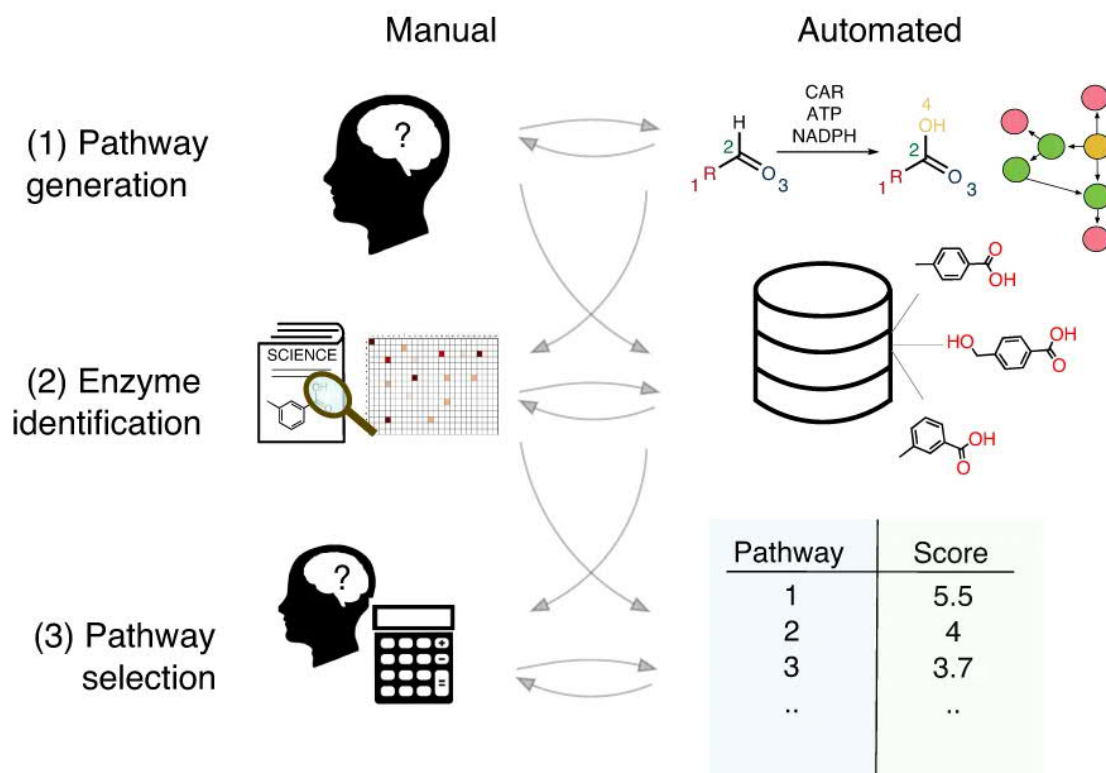

Could this pathway be used to produce 3-hydroxypropanoate in a yeast host?

$\text{acetyl-CoA} + \text{CO}_2 + \text{NADH} + \text{H}^+ \rightleftharpoons \text{3-oxopropanoate} + \text{CoA} + \text{NAD}^+$

$\text{3-hydroxypropanoate} + \text{NAD}^+ \rightleftharpoons \text{3-oxopropanoate} + \text{NADH} + \text{H}^+$

(<https://equilibrator.weizmann.ac.il/>)

Synthetic pathway design

Pathway search in

- Known (bio)chemical reactions
- Extended metabolic space
-> in graph or in genome-scale metabolic model

Candidate enzyme sequences from

- Homology based search in sequence resources
- Machine learning beyond sequence features
- Directed evolution
- Design of new-to-nature (Near Future?)

Pathway ranking

Conversion to a mathematical representation

Obeying the law of conservation of mass,
metabolite mass balances constrain metabolic phenotypes

$$\frac{dX}{dt} = \mathbf{S} \cdot \mathbf{v} = \mathbf{S} \cdot \mathbf{f}(\mathbf{e}(t), \mathbf{s}(t), \mathbf{p}) \quad (\text{Equation 1})$$

Figure modified by
Tuula Tenkanen from
O'Brien et al. 2015

Steady state assumption linearizes the mass balances

Flux Variability Analysis (FVA) Mahadevan et al. 2003

maximize and minimize v_i

subject to

$$S \cdot v = 0 \quad (\text{Equation 3})$$

$$c' \cdot v \geq \alpha \quad \alpha \text{ is the optimal value of the initial objective}$$

$$v, lb < v < v, ub$$

27/04/2021 VTT – beyond the obvious

- ⇒ While the objective has the optimal value other fluxes may vary
- ⇒ The ones that are non-zero are essential for the optimal value of the objective

1. Design of engineering strategies for optimizing production

From laboratory demonstration to industrial feasibility

Nielsen J and Keasling JD. *Cell* 2016 164, 1185-1197DOI: (10.1016/j.cell.2016.02.004)

Review on possibilities: Lee SY et al. (2019) <https://www.nature.com/articles/s41929-018-0212-4>

Microbial metabolism is optimized in evolution for survival and growth

Determinants of industrially feasible production:

1. *YIELD*

2. *TITER*

3. *VOLUMETRIC PRODUCTIVITY*

4. *SPECIFIC PRODUCTIVITY*

Task: what are the units of these?

1. *YIELD:*

g product/g substrate

2. *TITER:*

g product/l

3. *VOLUMETRIC PRODUCTIVITY:*

g product/ (l h)

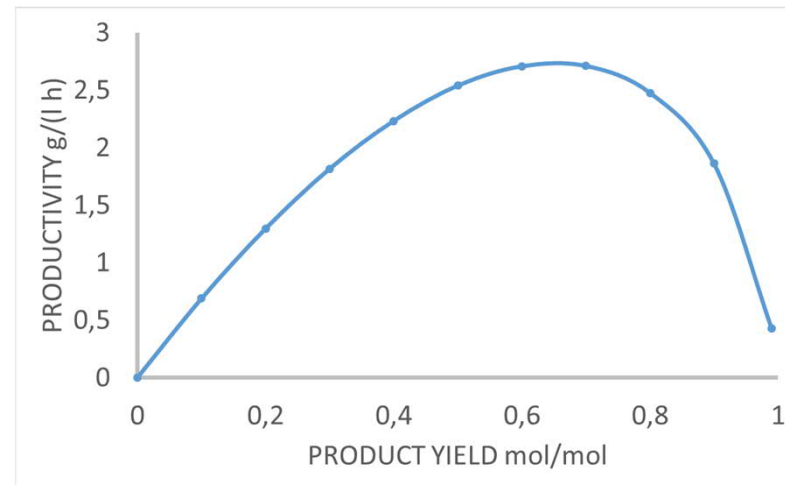

4. *SPECIFIC PRODUCTIVITY:*

g product/ (g biomass h)

$$\frac{g \text{ product}}{l \text{ h}} = \frac{g \text{ product}}{g \text{ biomass h}} * g \text{ biomass} / l$$

If production draws substantial resources from growth, PRODUCTIVITIES remain low and industrially infeasible

Batch process Monod model simulation for an example of a small molecule heterologous product in *S. cerevisiae*
