

SCHEDULE

	Date	Topic
1.	Tue 14.09.	Lec-1: Introduction
2.	Fri 17.09.	Lec-2: Crystal Chemistry & Tolerance parameter
3.	Fri 17.09.	EXERCISE 1
4.	Tue 21.09.	Lec-3: Crystal chemistry & BVS
5.	Fri 24.09.	Lec-4: Symmetry & Point Groups
6.	Fri 24.09.	EXERCISE 2
7.	Tue 28.10.	Lec-4: Crystallography & Space Groups
8.	Fri 01.10.	Lec-5: XRD & Reciprocal lattice
9.	Fri 01.10.	EXERCISE 3
10.	Tue 05.10.	Lec-6: ND & GI-XRD
11.	Fri 08.10.	Lec-7: Rietveld
12.	Fri 08.10	EXERCISE 4: Rietveld
13.	Tue 12.10.	Lec-8: Synchrotron rad. & XAS & RIXS
14.	Fri 15.10.	EXAFS & Mössbauer
15.	Fri 15.10.	EXERCISE 5
16.	Tue 19.10.	Seminars: XPS, FTIR, Raman, ED, HRTEM, SEM, AFM
17.	Fri 19.10.	Lec-12: XRR
18.	Fri 22.10.	EXERCISE 6: XRR

EXAM: Friday, Oct. 29th, 2021

SEMINAR TOPICS

- XPS: Topias Jussila
- AFM: Thapa Suman
- SEM: Emma-Lotta Kittilä
- ED/HRTEM: Warraich Hassaan Ahmad

INSTRUCTIONS for SEMINAR PRESENTATION/REPORT

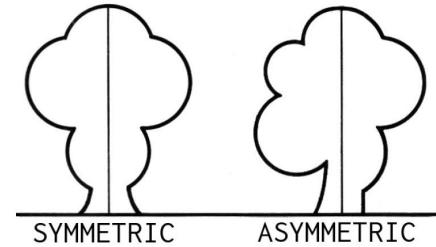

- ❖ Topics: **IR, Raman, XPS, SEM, AFM, HRTEM, ED, EELS**
- ❖ Seminar presentation is mandatory
- ❖ Given individually
- ❖ Evaluated in the scale: 10 ~ 20 points
- ❖ Presentation is given in English, and the slides will be put up in MyCourses afterwards
- ❖ Presentation: 25+5 minutes
- ❖ Rough content of the presentation/report:
 - principle of the technique
 - type of information gained
 - interpretation of the measured data
 - pros & cons
 - two to three research examples
(you will be given some relevant research papers for an example)

LECTURE 4: SYMMETRY

- Greek "*symmetrein*" (= commensurate, yhteismitallinen)
- Symmetry elements & operations
- Molecular symmetry
- Point groups

SYMMETRY

- Some people see beauty in symmetry, some in asymmetry
- Symmetry is also common in nature

IN CHEMISTRY ...

MOLECULAR SYMMETRY

Important for understanding/explaining/classification

- Molecule structures
- Crystal structures
- Quantum chemistry
- Spectroscopy (IR, Raman)
- Material properties, e.g. ferro/piezoelectricity

SYMMETRY OPERATION

Operation that generates the same representation of an object (molecule)

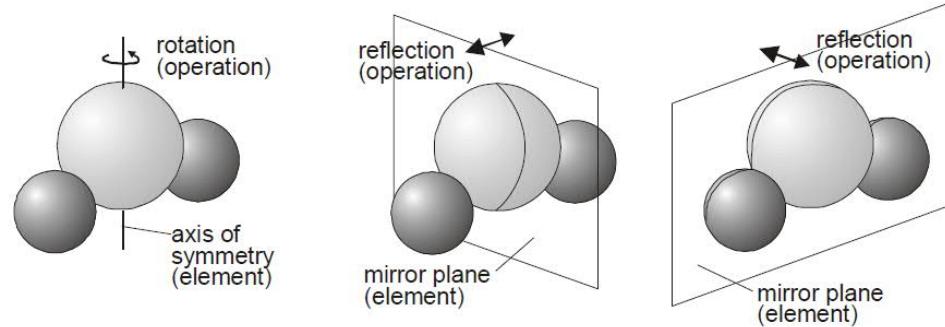

SYMMETRY ELEMENT

Each symmetry operation has a corresponding symmetry element (point, axis, plane) about which the operation takes place

MOLECULAR SYMMETRY

Operations & Elements

(historical Schönlies notation;
used also in spectroscopy)

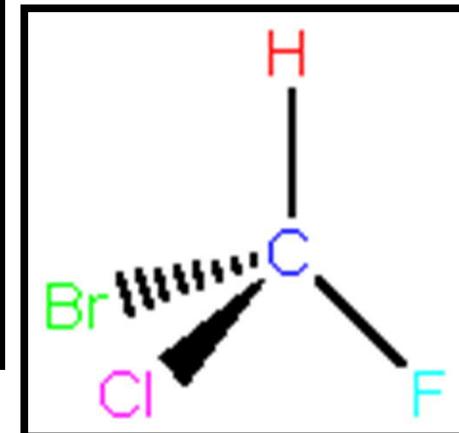

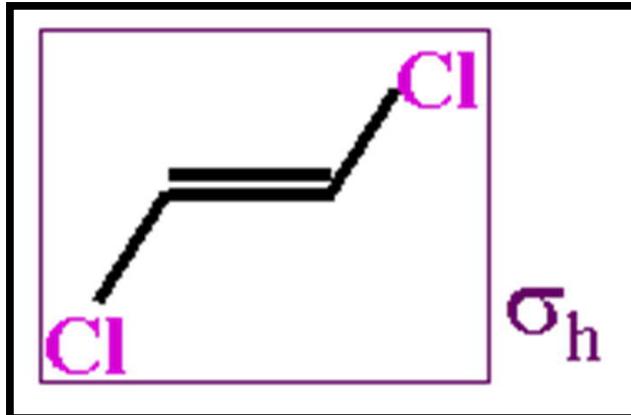

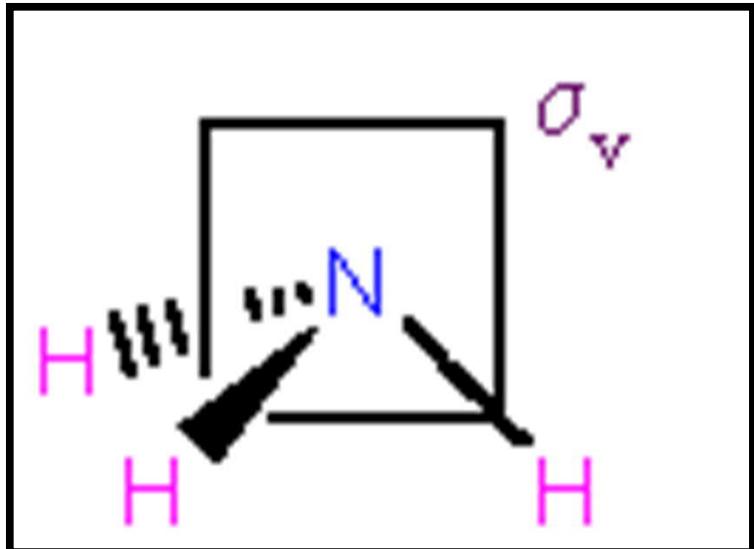

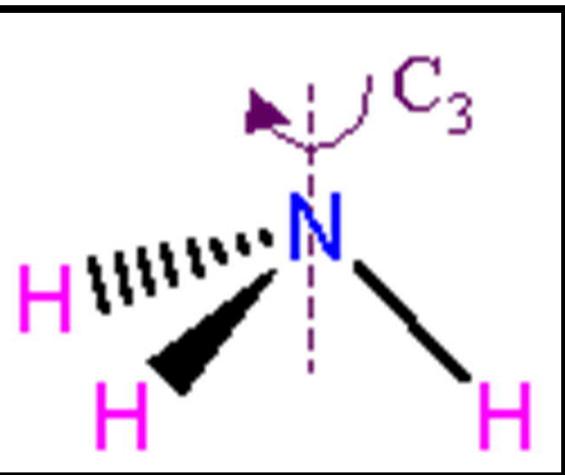

Molecular symmetry: at least one point remains unchanged

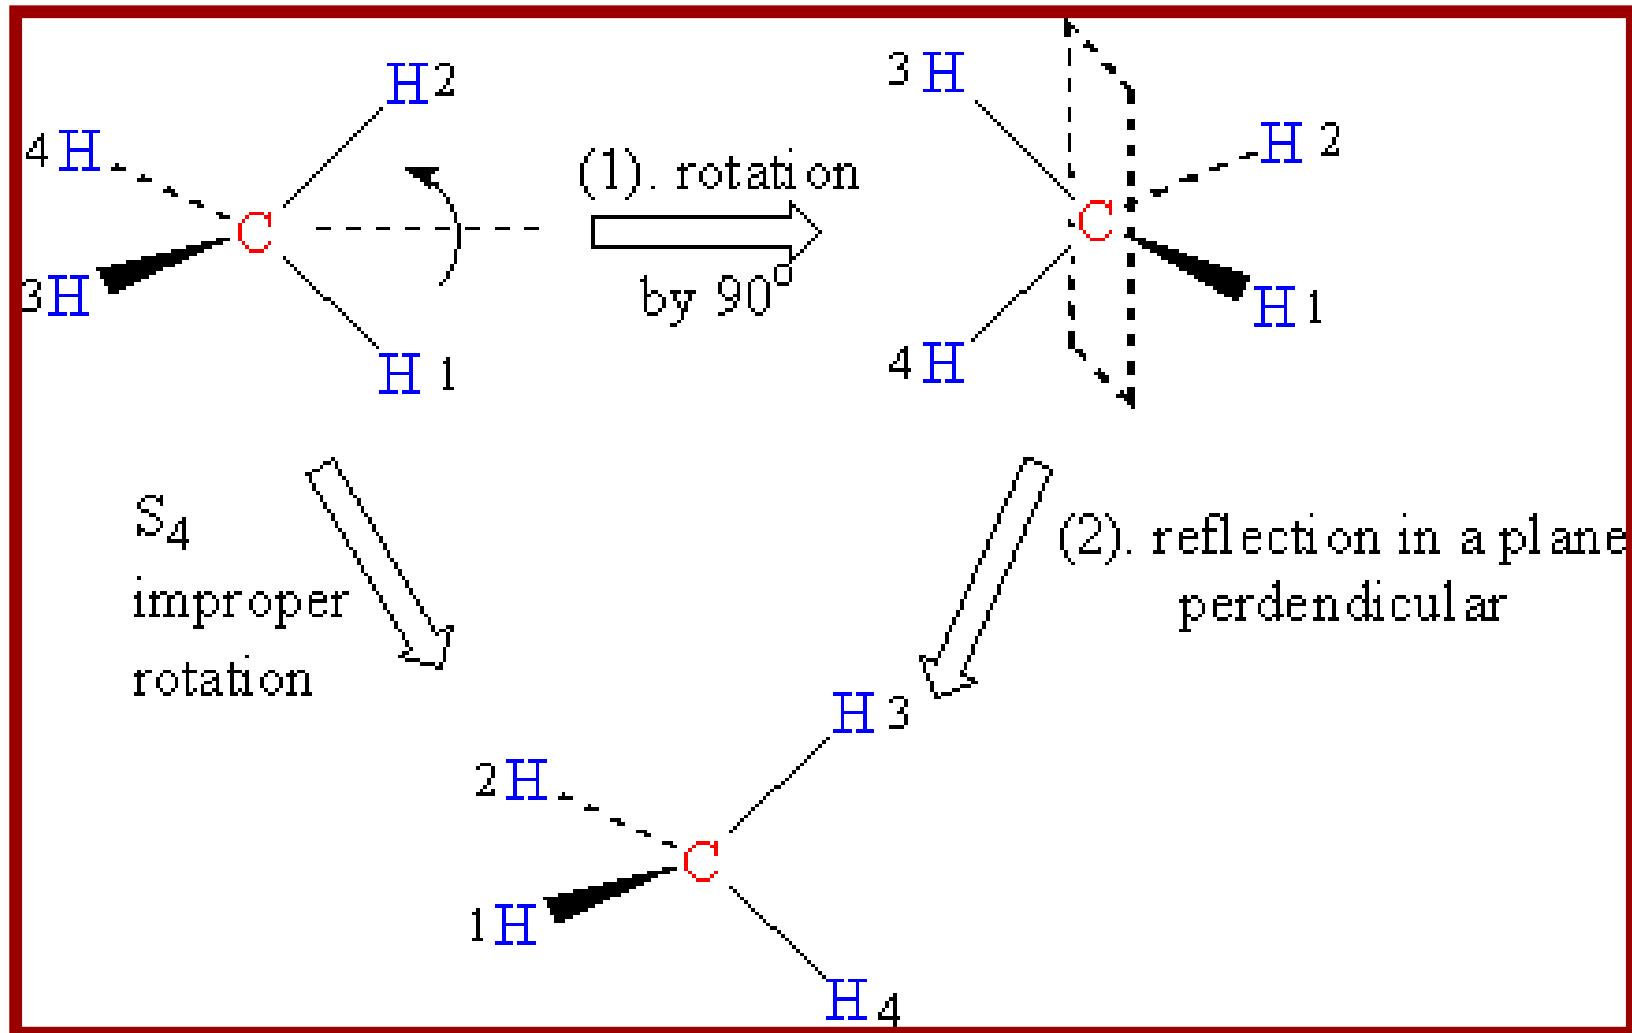

- **Identity (E; German Einheit):** No change; every molecule has E
- **Rotation axis (C_n):** Rotation by $360^\circ/n$ ($n = 1, 2, 3, \dots$) about an axis, which leaves the molecule unchanged
- **Symmetry or mirror plane (σ):** Plane through which reflection leaves the molecule unchanged:
 - σ_v : vertical mirror plane (in relation to rotation axis)
 - σ_h : horizontal mirror plane (in relation to rotation axis)
- **Center of symmetry (i):** center through which inversion leaves the molecule unchanged
- **Improper rotation (or rotary-reflection) axis (S_n):** Rotation about an axis by $360^\circ/n$, followed by reflection in a plane perpendicular to the axis.
Note: $S_1 = \sigma$; $S_2 = i$

Proper: Can be actually done on a molecule: E, C_n

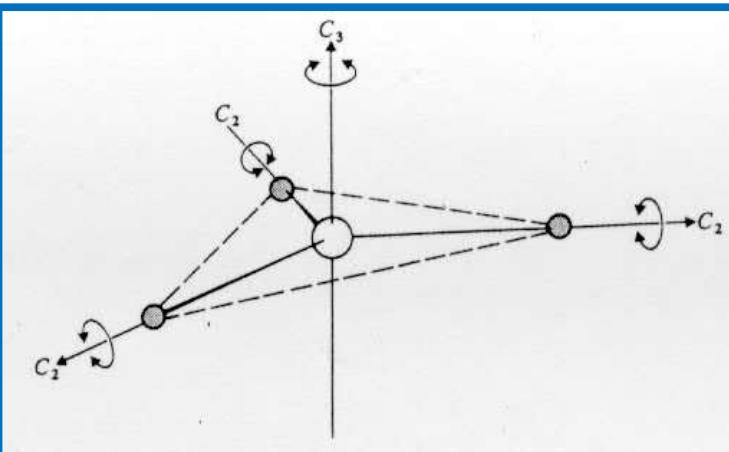

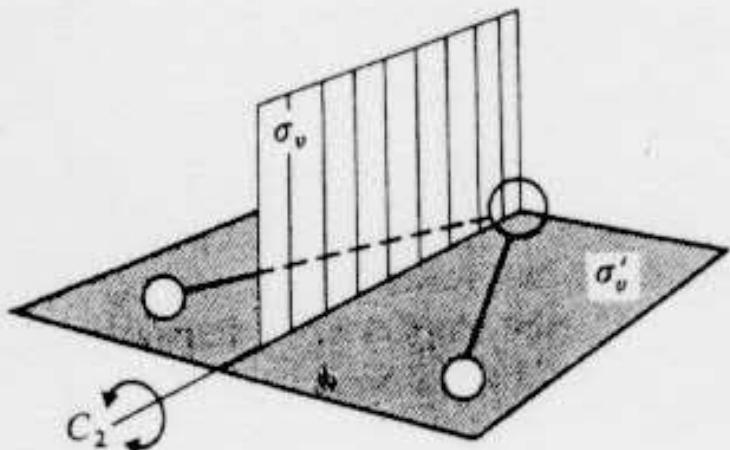

Improper: Can be only imagined, not done: σ , I, S_n
(drastic chemical bond rearrangements)

Rotary-reflection: CH_4

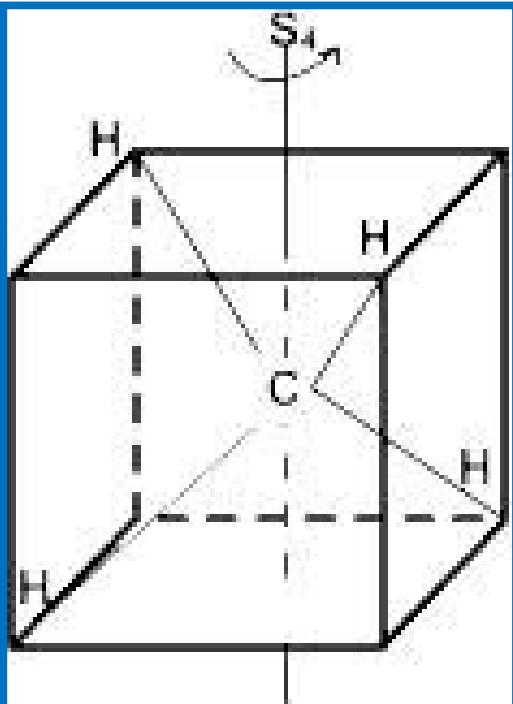

H_2O

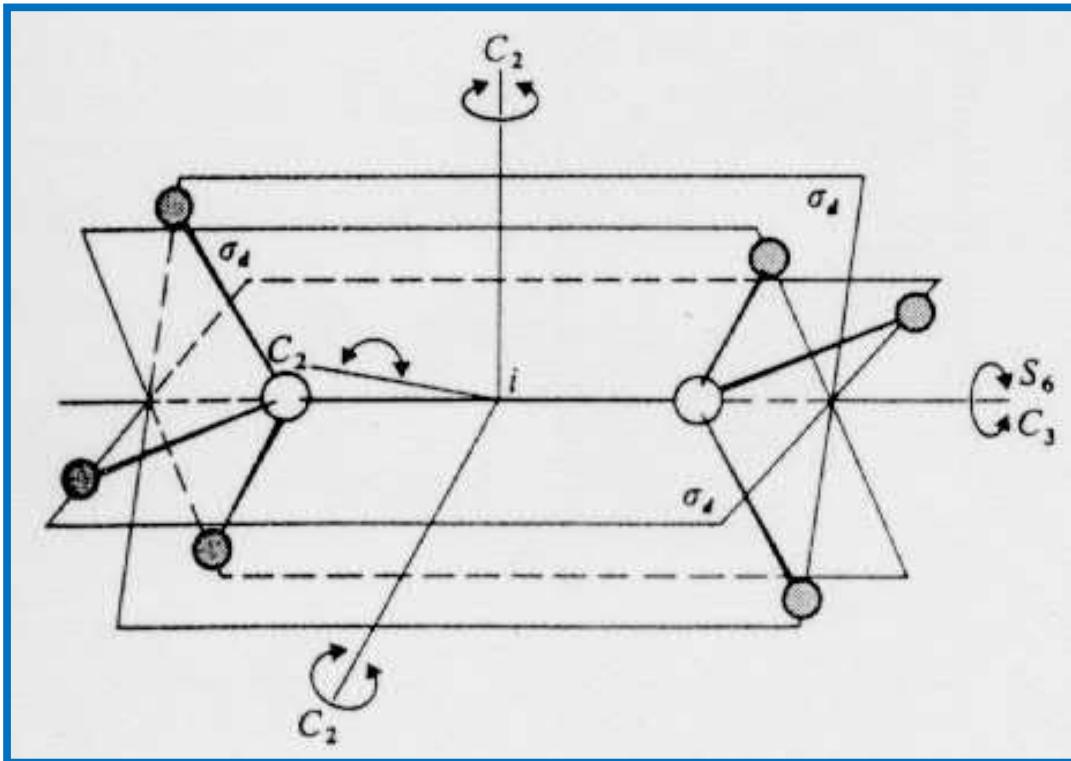

BF_3

CH_4

Ethane (staggered): CH_3-CH_3

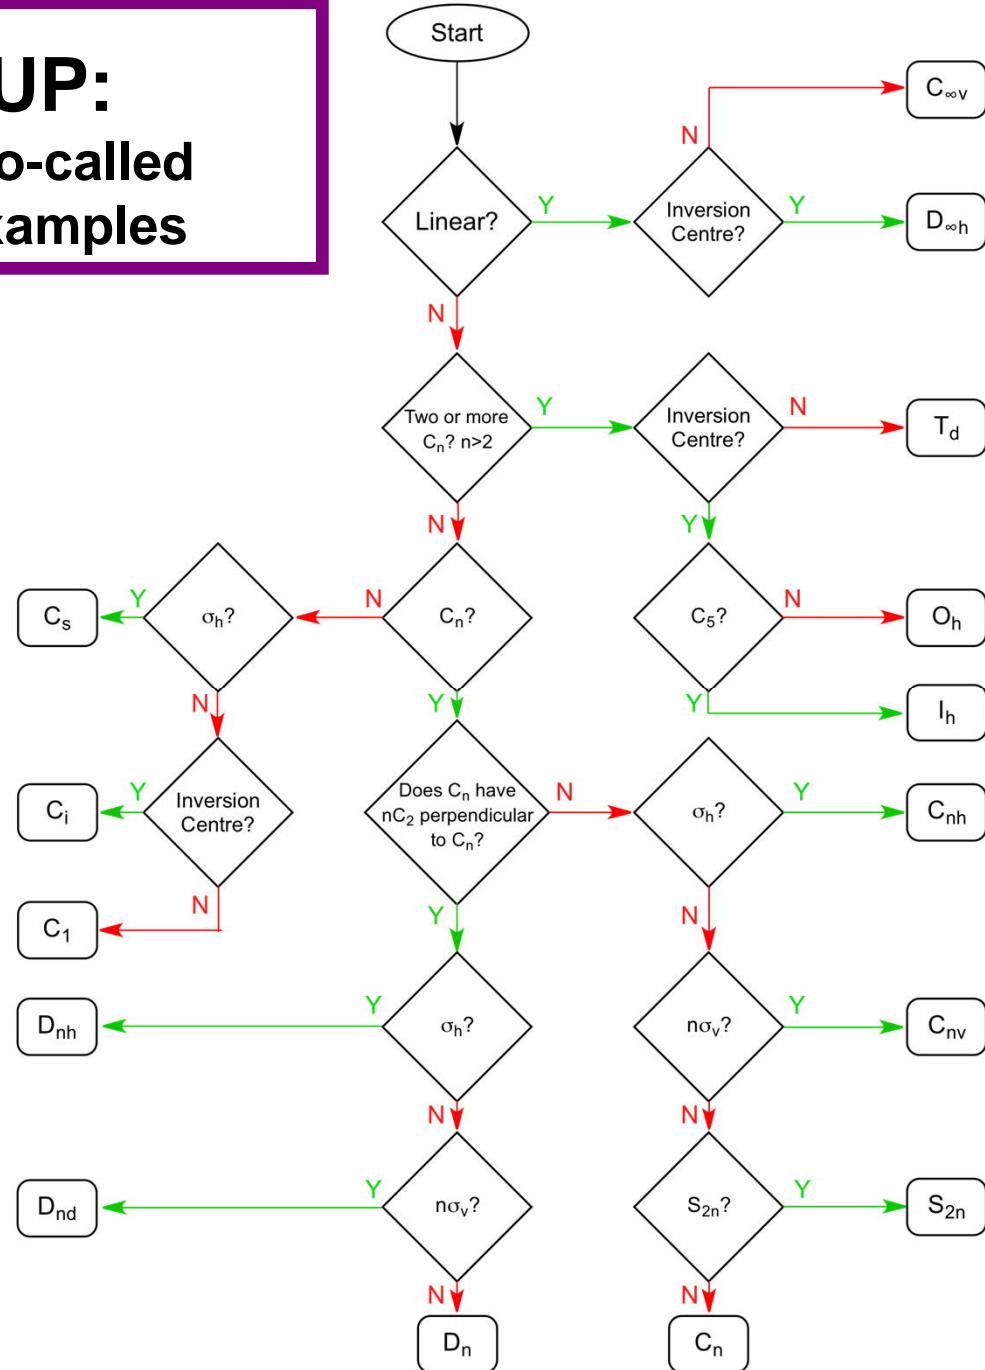

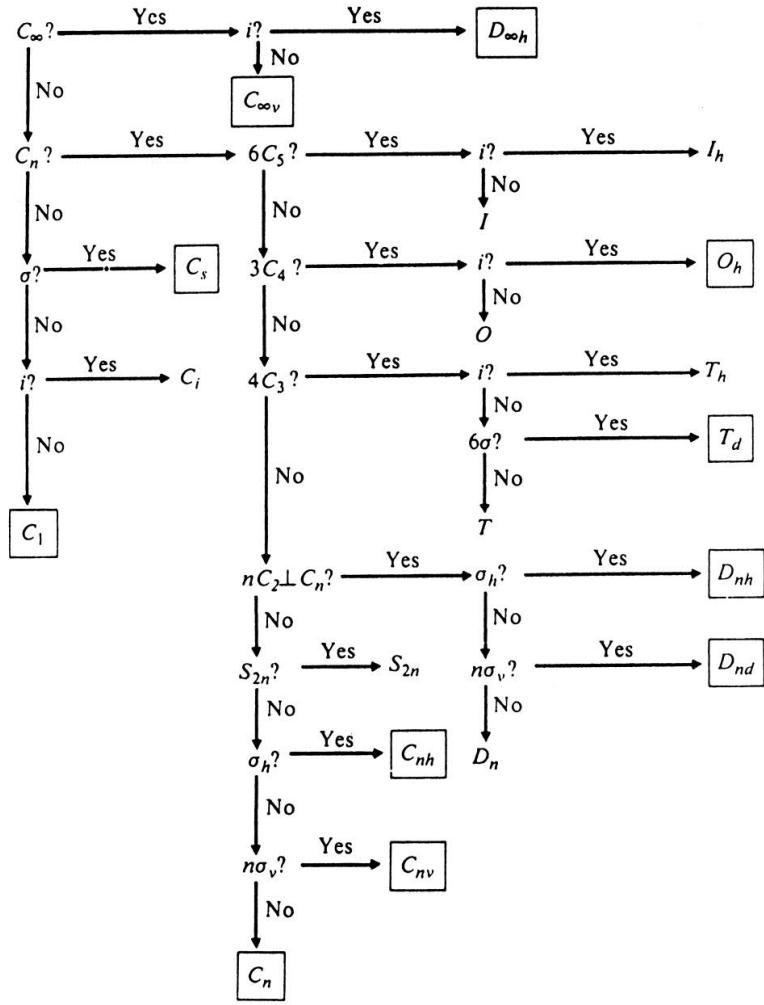

POINT GROUP

- Summarizes all the symmetry operations that can be performed on a certain molecule
- Describes unambiguously the symmetry of the molecule
- In principle there are infinite number of space groups (combinations of symmetry elements); in practice ca. 40 different point groups are enough to classify all the known molecules
- Point groups are named: C_2 , C_{2v} , D_{3h} , O_h , T_d ... (**Schönflies**)

Finding the POINT GROUP:

There are a number of routes or so-called symmetry trees; here are some examples

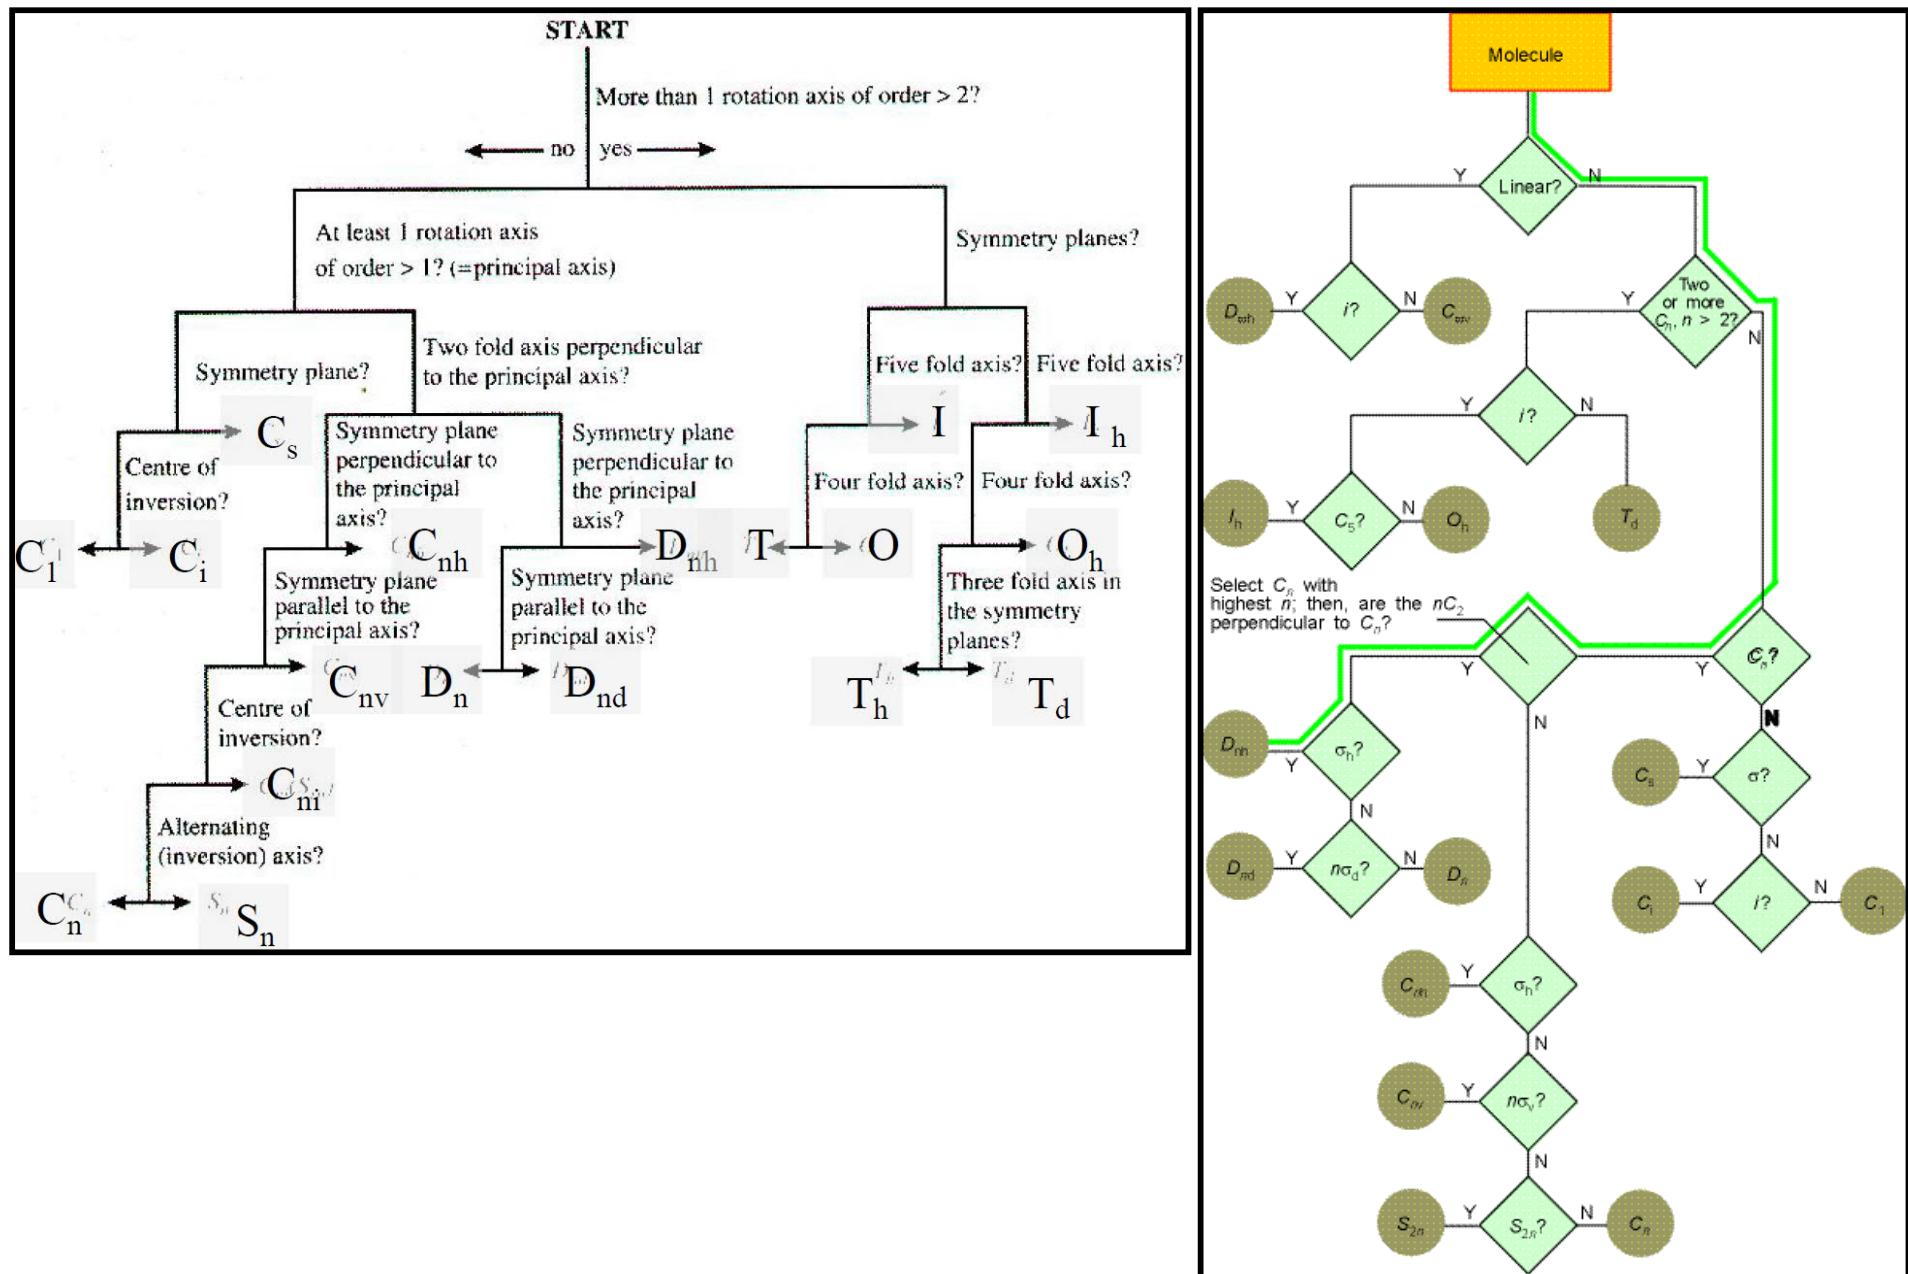

Point Groups

Every molecule has a set of symmetry elements.
This set is called the Point Group of the molecule.

Nonaxial	C_n	C_{nv}	C_{nh}	D_n	D_{nh}	D_{nd}	S_n	Higher	Linear
C_1	C_2	C_{2v}	C_{2h}	D_2	D_{2h}	D_{2d}	S_4	T_d	$C_{\infty v}$
C_s	C_3	C_{3v}	C_{3h}	D_3	D_{3h}	D_{3d}	S_6	O_h	$D_{\infty h}$
C_i	C_4	C_{4v}	C_{4h}	D_4	D_{4h}	D_{4d}	S_8	I_h	
	C_5	C_{5v}	C_{5h}	D_5	D_{5h}	D_{5d}	S_{10}		
	C_6	C_{6v}	C_{6h}	D_6	D_{6h}	D_{6d}			

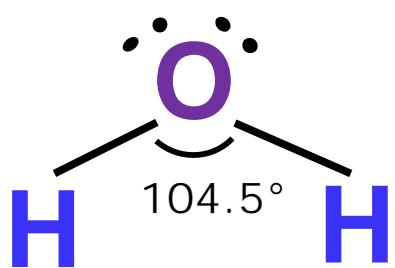

Character table for D_{3h} point group

	E	$2C_3$	$3C'_2$	σ_h	$2S_3$	$3\sigma_v$	linear, rotations	quadratic
--	---	--------	---------	------------	--------	-------------	----------------------	-----------

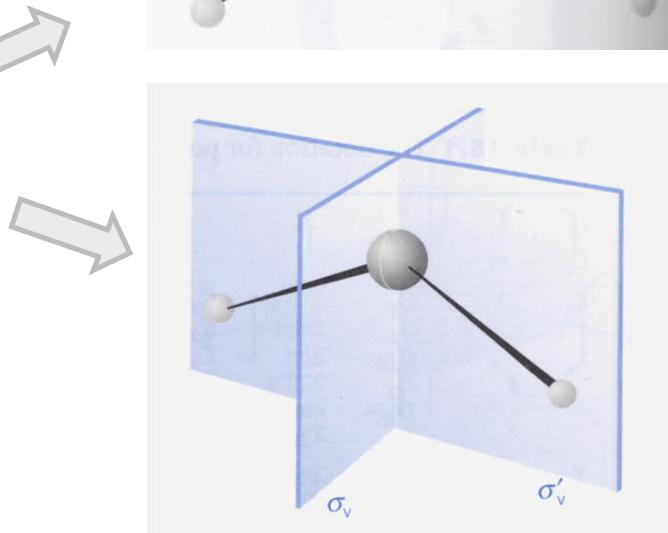

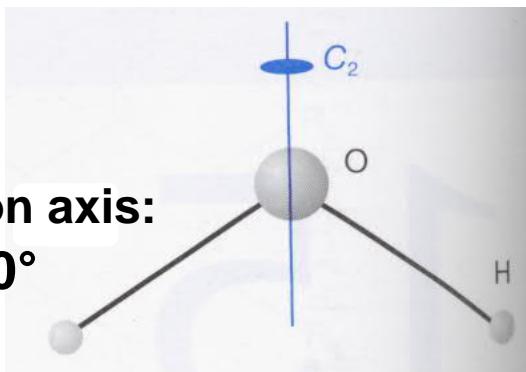

EXAMPLE: H_2O

C_{2v}

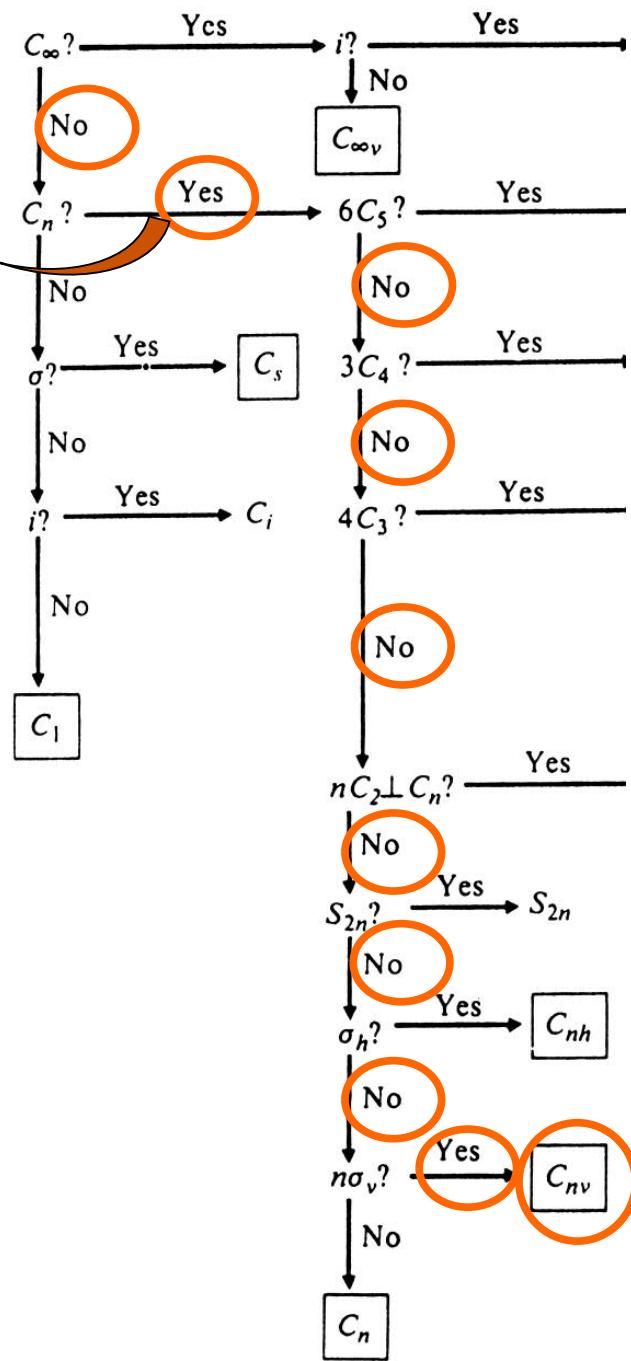

Rotation axis:
 180°

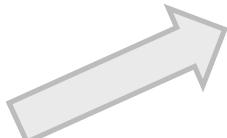

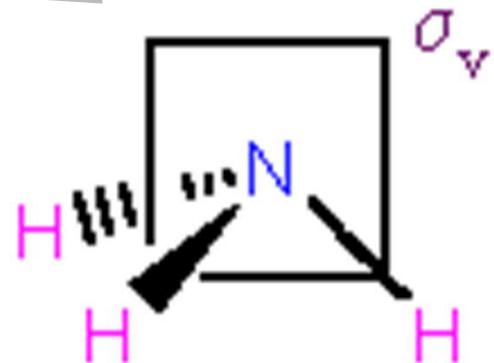

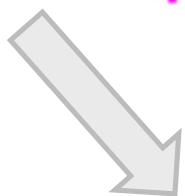

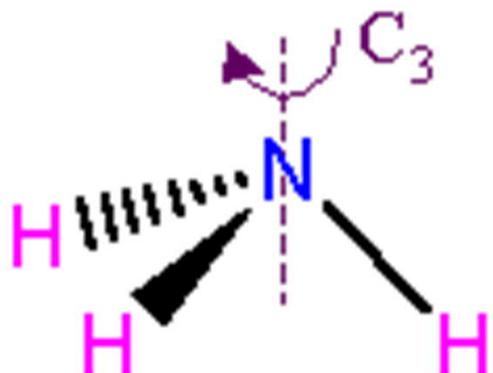

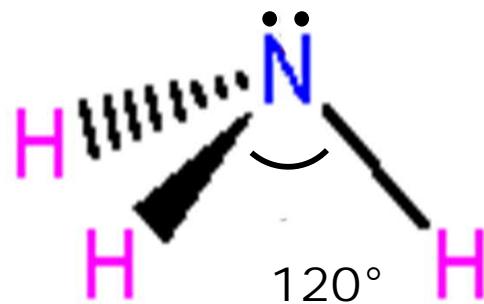

Vertical mirror plane: 2

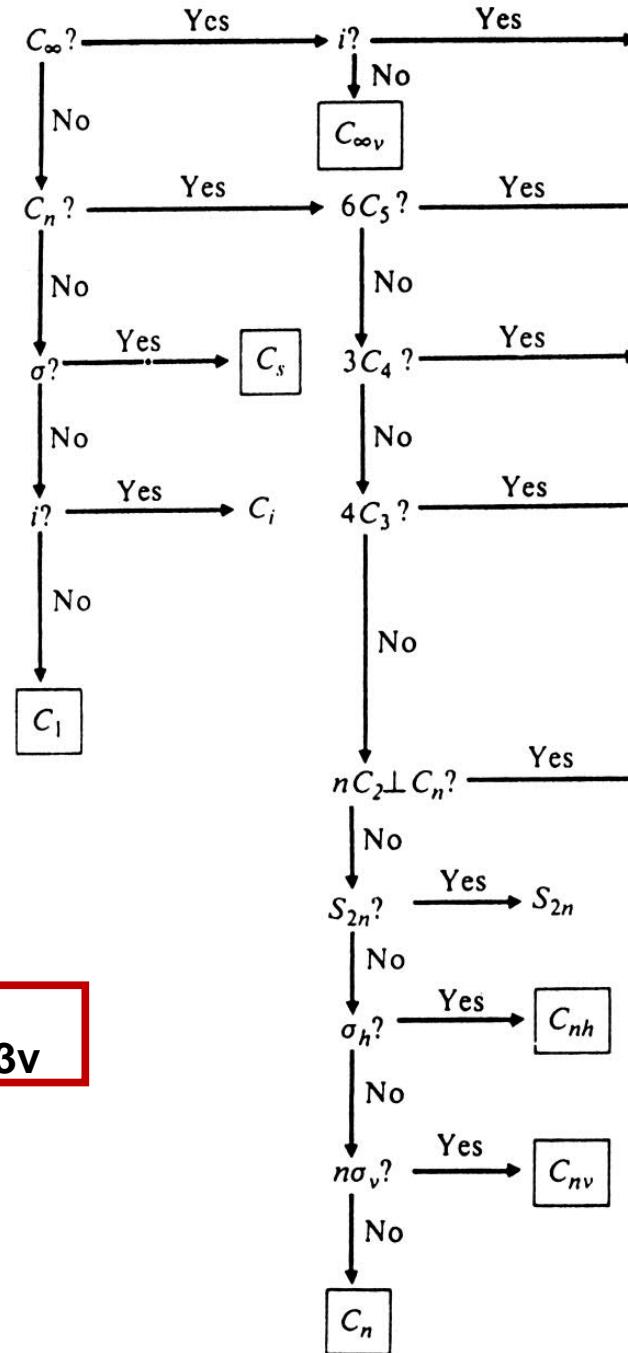

$n = 2$

EXAMPLE: NH_3

C_{3v}

EXAMPLES

HCl

∞ -fold rotation axis along the H-Cl bond, but no inversion center → $C_{\infty v}$

BFCIBr (planar, B in a middle of triangle)

Only symmetry plane (where the atoms are) → C_s

trans-N₂O₂²⁻ (planar)

One C_2 rotation axis perpendicular to the plane where the atoms are, no S_4 rotary-reflection axis, but horizontal symmetry plane → C_{2h}

CH₄ (tetraedric)

Four C_3 rotation axes, no inversion center, six symmetry planes → T_d

S₈

One C_4 and four C_2 rotation axes perpendicular to C_4 , no horizontal symmetry plane, but four vertical symmetry planes → D_{4d}
