Concept Description

In normal village, buildings are organized horizontally. Architecture and landscape interleave and embrace with each other horizontally in each block. Our concept of vertical village is the stack of horizontal village connected by paths. We called each single village one cluster, in which various functions interacted with landscape.

Landscape is a crucial part of people's life when communicating with architecture. The impact of landscape varies from different definition of landscape.

In this project, our definition of landscape is farming composed of two parts, the traditional farming and the vertical farming. Traditional farming could be regarded as the extension of greenery area, with which people could not only benefit from the views, but also having social activities during the planting and cultivating. As for the vertical farming, it is a industrial production. People living in the building would be supplied by the agricultural production planted in the vertical farming area inside the tower.

Sunlight is the main factor to control the space organization inside towers. Sunlight was used to control the function distribution and the airium size. Another important method we use is the growth. We use the sun energy proportion as the starting curves and input the function area proportion as the growth speed, let the space grow in the defined boundary. Then use the boundary negotiation to adjust the final result.

The whole tower is a dynamic system controlled by different proportion of functions input.

Concept

A. Village

Horizontal/Normal Village

Vertical Village

B. Farming

Vertical Farming -
Production

Traditional Farming -
Social activity

C. Cluster

Sun position and
farming position

Vertical Farming
Supply for the Residence

Traditional Farming
Social activity

Atrium
Public radiation

Vertical Farming
Supply For market and
Restaurant

Vertical farming
produces agricultural
product

Process

1.site

2.reshape the site to connect different levels and create paths

3.test for the least shadow to generate the main volume

4.tracing the sunlight to generate the farm

5.farm system connect with the site

6.devide into clusters

7.atrium in each cluster controlled by sunlight

8.function distribution

Farm Generation

1.site with towers

2.tracing sunlight

3.intersect with tower

4.direction

5.radial pattern

6.farm

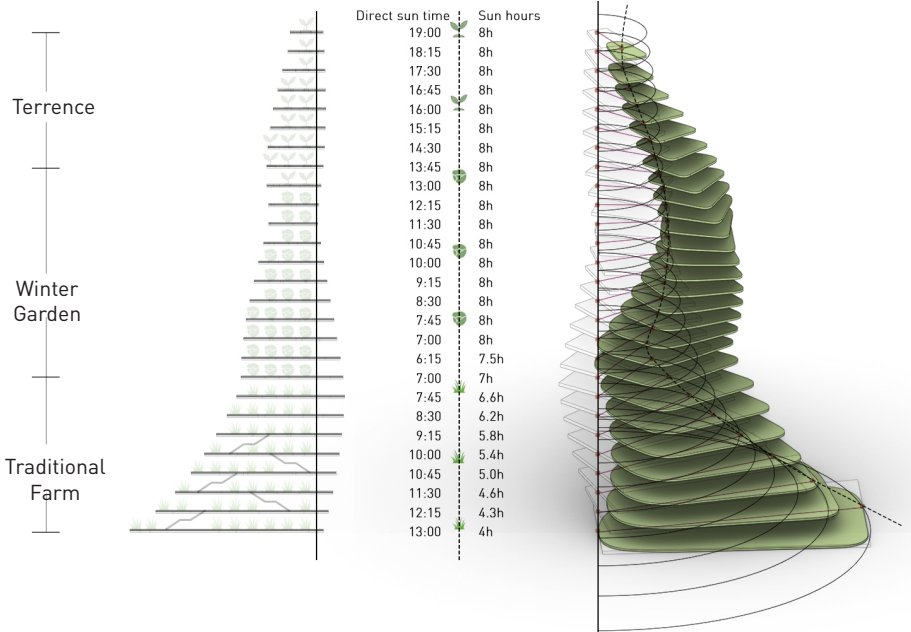

7.movement

8.farm connection

9.farm system

Axonomic View

There are two levels to allocate the flow of people from streets and inside building.

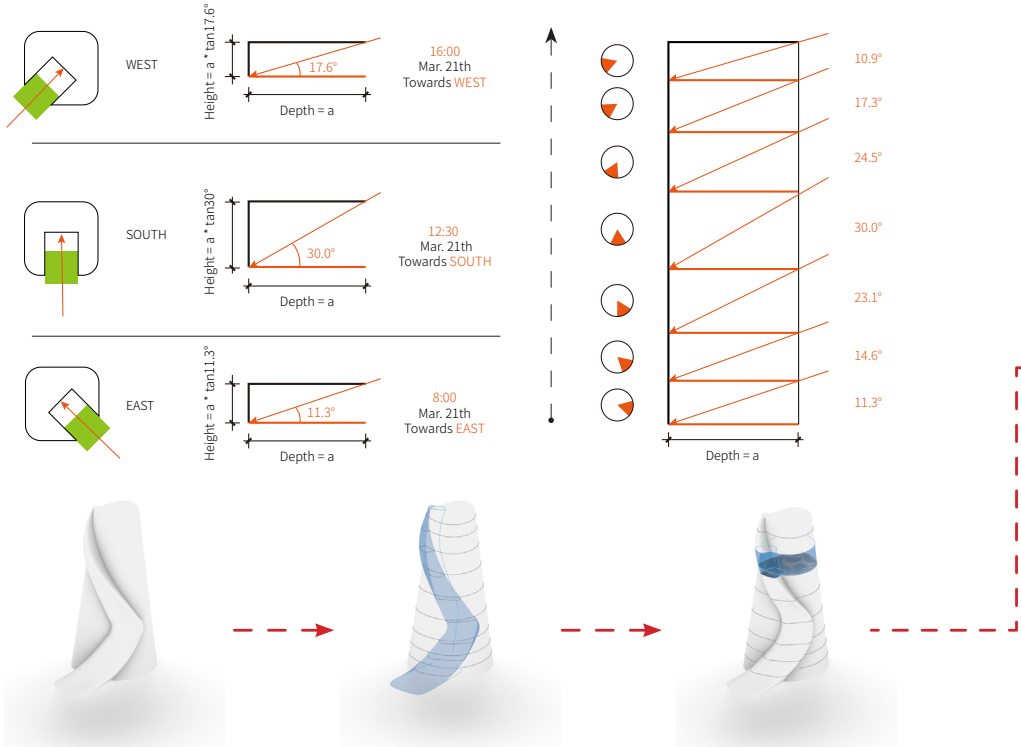

The site is reshaped not only to connect levels with height difference, but also have the rainwater collection system along with it.

The farms in two tower connect each other in the lower part and create public space and farmer's market for people to wander in the site.

Cluster division

Logic in Cluster

A. Sun Light

B. Sun Light proportion

C. Area proportion

Cluster	Floor	Function	Sun energy proportion	Area proportion
	13	Residence	30%	40%
		Office	60%	50%
		Shop	10%	10%
	14	Residence	20%	40%
		Office	60%	50%
		Exhibition	20%	10%
	15	Residence	30%	60%
		Office	60%	30%
Market		10%	10%	

1. One

2. Divide into floors

3. Calculate sun

4. Offset space

5. Set the starting curves based on the sun energy proportion

6. Populate cells

7. Space growth

8. Transform point into space

9. Boundary negotiation

Spatial solution growth process

Adjacency to the farm_[1]
 Proportion of the sunlight harvested_[2]
 Area occupied_[3]

Adjacency to the lightwells and tower's atriums_[4]

Access from the bedrock top is combined with the restaurant terrace
 Main entrance from the street lead to the local market
 People flow_[5]
 Underground path, connects Pasila parts. Quick services.
 Cells do not block people movement

Typical floors

Ground floor
 Green_[3] - 25%_[4]_[5]
 Retail_[3] - 55%_[5]

2nd floor
 Green_[4]_[3] - 10%
 Retail_[3] - 20%_[5]
 Market_[3] - 45%_[5]_[1]
 Learning center_[3] - 25%_[5]_[1]

3rd floor
 Green_[4]_[3] - 10%
 Restaraunt_[3] - 40%_[5]
 Market_[3] - 25%_[5]_[1]
 Learning center_[3] - 25%_[5]_[1]

To allow sunlight inside the atrium, each cluster incorporates the open space next to the most sunny part of the facade, which is then used as a local market and shared kitchen unit due to its adjacency to the farm. These units are fully glazed.

Growth process is based on the python script which generates the cells of the specific function via finding the balance between input parameters. Each area has specific priority based on its location, function.

Possible cell typology:

Open spaces\
Co-working_
50-70sqm

Individual units for
remote working
15_20_30sqmv

Office units

Student housing\
Social housing_15_20sqm

Studio apartments
40_50sqm

2-3 room family apart-
ment
60_70sqm

Living units

Retail/Service
_3] 10- 55%
_5]

Museum_3]- 60% _2] 90%-50%
Exhibition _3]- 40% _2] 10%
Farm workshop_3]- 30% _2] 60%
Learning center__3] - 25% _5] _1]

Restaraunt/Cafe
_3] 20- 40%
_5]
_2] 20%

Local market\Shared kitchen
_3] - 10-25% _5] _1]

Offices
_3] - 10-75%
_2] 30%

Residential
_3] - 40-75%
_2] 60%

Green areas programm and building circulation

Traditional farms are located on the building "slopes"

Vertical farms are located on the sunniest parts of the facade. Defined by the sun rays projections on the facade.

Inner greenery yards are connected in the individual ecosystem. Suitable for the indoor plants. Not enough sun for farming.

Last floor of the vertical farm block is used for the farm management/storing/distribution of goods to all consumers.

All vertical farms and the managing floor are connected with the shortest path possible. It is then used for the product harvesting, water supply, waste management.

Cluster inner yards are connected with the vertical farming, where 5% of the space is reserved for the private use by cluster users.

Section and path system

Green areas inside the building are distributed based on the script using parametrs :

- Occupied area (20-30%)
- Adjacency to the lightwells
- Adjacency to the tower's atrium
- People flow (Cells do not block people movement)

The paths in the farm system of two towers are calculated by the shortest walk. The height of farm space in each cluster is defined by the sunlight.

The paths inside the atrium of two towers are calculated by the shortest walk and also connected with the paths of farm system which is in the exterior WW.
