I want to control – How to control environmental parameters in the space?

Background

Lighting control through the wall panels is indeed known a very long time. Light also reacts very fast. Other environmental parameters are not reacting as fast and controlling is sometimes more difficult. What parameters in the space people actually would like to control? If there are multiple Different type UI:s in the space, that generates messy outlook, and limited usability.

Task

Design & implement the ultimate UI device for environmental parameter(s), that is easy and intuitive to use. Preferable it sends control messages by using Bluetooth. Things to consider:

- Do you focus on specific area, like office, school, hospitality…. Or will you create general solution?
- How to make it intuitive?
- Where it should be located? Or is it based on computer vision?
- Is some kind of AI involved?
- How to power the device?
- Are you focusing on one parameter or multiple environmental parameters?
