freeworld.posterous.com

# Linux Bash Shell Cheat Sheet

(works with about every distribution, except for apt-get which is Ubuntu/Debian exclusive)

Legend:

Everything in "<>" is to be replaced, ex: <fileName> --> iLovePeanuts.txt
Don't include the '=' in your commands
'..' means that more than one file can be affected with only one command ex: rm
file.txt file2.txt movie.mov .. ..

Basic Commands

### Basic Terminal Shortcuts

CTRL L = Clear the terminal CTRL D = Logout SHIFT Page Up/Down = Go up/down the terminal CTRL A = Cursor to start of line CTRL E = Cursor the end of line CTRL U = Delete left of the cursor CTRL K = Delete right of the cursor CTRL W = Delete word on the left CTRL Y = Paste (after CTRL U,K or W) TAB = auto completion of file or command CTRL R = reverse search history !! = repeat last command CTRL Z = stops the current command (resume with fg in foreground or bg in background) Basic Terminal Navigation

cd .. = go up one folder, tip: ../../

du -h: Disk usage of folders, human readable
du -ah: " " files & folders, Human readable
du -sh: only show disc usage of folders

pwd = print working directory

man <command> = shows manual (RTFM)

#### Basic file manipulation

```
cat <fileName> = show content of file
             (less, more)
head = from the top
      -n <#oflines> <fileName>
tail = from the bottom
      -n <#oflines> <fileName>
mkdir = create new folder
mkdir myStuff ..
mkdir myStuff/pictures/ ..
cp image.jpg newimage.jpg = copy and rename a file
cp image.jpg <folderName>/ = copy to folder
cp image.jpg folder/sameImageNewName.jpg
cp -R stuff otherStuff = copy and rename a folder
cp *.txt stuff/ = copy all of *<file type> to folder
mv file.txt Documents/ = move file to a folder
mv <folderName> <folderName2> = move folder in folder
mv filename.txt filename2.txt = rename file
mv <fileName> stuff/newfileName
mv <folderName>/ .. = move folder up in hierarchy
rm <fileName> .. = delete file (s)
rm -i <fileName> .. = ask for confirmation each file
rm -f <fileName> = force deletion of a file
rm -r <foldername>/ = delete folder
touch <fileName> = create or update a file
ln file1 file2 = physical link
ln -s file1 file2 = symbolic link
```

**Basic Commands** 

### Researching Files

```
The slow method (sometimes very slow):
                                                                      grep <someText> <fileName> = search for text in file
                                                                             -i = Doesn't consider uppercase words
locate <text> = search the content of all the files
                                                                            -I = exclude binary files
locate <fileName> = search for a file
                                                                      grep -r <text> <folderName>/ = search for file names
                                                                            with occurrence of the text
sudo updatedb = update database of files
                                                                      With regular expressions:
find = the best file search tool(fast)
find -name "<fileName>"
find -name "text" = search for files who start with the word text
                                                                      grep -E ^<text> <fileName> = search start of lines
find -name "*text" = "
                       """end"""
                                                                      with the word text
                                                                      grep -E <0-4> <fileName> =shows lines containing numbers 0-4
Advanced Search:
                                                                      grep -E <a-zA-Z> <fileName> = retrieve all lines
                                                                      with alphabetical letters
Search from file Size (in ~)
      find ~ -size +10M = search files bigger than.. (M.K.G)
                                                                      sort = sort the content of files
                                                                      sort <fileName> = sort alphabetically
Search from last access
                                                                      sort -o <file> <outputFile> = write result to a file
      find -name "<filetype>" -atime -5
                                                                      sort -r <fileName> = sort in reverse
            ('-' = less than, '+' = more than and nothing = exactly)
                                                                      sort -R <fileName> = sort randomly
                                                                      sort -n <fileName> = sort numbers
Search only files or directory's
      find -type d --> ex: find /var/log -name "syslog" -type d
                                                                      wc = word count
      find -type f = files
                                                                      wc <fileName> = nbr of line, nbr of words, byte size
                                                                             -1 (lines), -w (words), -c (byte size), -m
More info: man find, man locate
                                                                             (number of characters)
                                                                      cut = cut a part of a file
                                                                      -c --> ex: cut -c 2-5 names.txt
                                                                             (cut the characters 2 to 5 of each line)
                                                                      -d (delimiter)
                                                                                            (-d & -f good for .csv files)
                                                                      -f (# of field to cut)
```

more info: man cut, man sort, man grep

Extract, sort and filter data

Basic Commands

### Time settings

date = view & modify time (on your computer) View: date "+%H" --> If it's 9 am, then it will show 09 date "+%H:%M:%Ss" = (hours, minutes, seconds) %Y = vearsModify: MMDDhhmmYYYY Month | Day | Hours | Minutes | Year sudo date 031423421997 = March 14<sup>th</sup> 1997, 23:42 Execute programs at another time use 'at' to execute programs in the future Step 1, write in the terminal: at <timeOfExecution> ENTER ex --> at 16:45 or at 13:43 7/23/11 (to be more precise) or after a certain delay: at now +5 minutes (hours, days, weeks, months, years) Step 2: <ENTER COMMAND> ENTER repeat step 2 as many times you need Step 3: CTRL D to close input atg = show a list of jobs waiting to be executed atrm = delete a job n°<x> ex (delete job #42) --> atrm 42 sleep = pause between commands with ';' you can chain commands, ex: touch file; rm file you can make a pause between commands (minutes, hours, days) ex --> touch file; sleep 10; rm file <-- 10 seconds

### (continued)

```
crontab = execute a command regularly
      -e = modify the crontab
      -1 = view current crontab
      -r = delete you crontab
In crontab the syntax is
<Minutes> <Hours> <Day of month> <Day of week (0-6,
0 = Sunday)> <COMMAND>
ex, create the file movies.txt every day at 15:47:
47 15 * * * touch /home/bob/movies.txt
* * * * * --> every minute
at 5:30 in the morning, from the 1<sup>st</sup> to 15<sup>th</sup> each month:
30 5 1-15 * *
at midnight on Mondays, Wednesdays and Thursdays:
0 0 * * 1,3,4
every two hours:
0 */2 * * *
every 10 minutes Monday to Friday:
*/10 * * * 1-5
Execute programs in the background
Add a '&' at the end of a command
      ex --> cp bigMovieFile.mp4 &
nohup: ignores the HUP signal when closing the console
(process will still run if the terminal is closed)
      ex --> nohup cp bigMovieFile.mp4
jobs = know what is running in the background
fg = put a background process to foreground
      ex: fg (process 1), f%2 (process 2) f%3, ...
```

Basic Commands

### Process Management

```
w = who is logged on and what they are doing
tload = graphic representation of system load average
      (quit with CTRL C)
ps = Static process list
      -ef --> ex: ps -ef | less
      -ejH --> show process hierarchy
      -u --> process's from current user
top = Dynamic process list
While in top:

    q to close top

    h to show the help

    k to kill a process

CTRL C to top a current terminal process
kill = kill a process
      You need the PID # of the process
             ps -u <AccountName> | grep <Application>
      Then
             kill <PID> .. .. ..
kill -9 <PTD> = violent kill
killall = kill multiple process's
      ex --> killall locate
extras:
      sudo halt <-- to close computer
      sudo reboot <-- to reboot
```

### Create and modify user accounts

sudo adduser bob = root creates new user sudo passwd <AccountName> = change a user's password sudo deluser <AccountName> = delete an account

addgroup friends = create a new user group delgroup friends = delete a user group

usermod -g friends <Account> = add user to a group usermod -g bob boby = change account name usermod -aG friends bob = add groups to a user without loosing the ones he's already in

#### File Permissions

chown = change the owner of a file ex --> chown bob hello.txt chown user:bob report.txt = changes the user owning report.txt to 'user' and the group owning it to 'bob' -R = recursively affect all the sub folders ex --> chown -R bob:bob /home/Daniel

chmod = modify user access/permission - simple way
 u = user
 g = group
 o = other

 d = directory (if element is a directory)
 l = link (if element is a file link)
 r = read (read permissions)
 w = write (write permissions)
 x = eXecute (only useful for scripts and
 programs)

Basic Commands

### File Permissions (continued)

- '+' means add a right '-' means delete a right '=' means affect a right

more info: man chmod

### Flow redirection

Redirect results of commands:

'>' at the end of a command to redirect the result to a file ex --> ps -ejH > process.txt '>>' to redirect the result to the end of a file

#### Redirect errors:

'2>' at the end of the command to redirect the result to a file ex --> cut -d , -f 1 file.csv > file 2> errors.log '2>&1' to redirect the errors the same way as the standard output

Read progressively from the keyboard

```
<Command> << <wordToTerminateInput>
```

ex --> sort << END <-- This can be anything you want

- > Hello
- > Alex > Cinema
- > Game
- > Code
- > Ubuntu
- > END

## Flow Redirection (continued)

terminal output: Alex Cinema Code Game Ubuntu

Another example --> wc -m << END

## Chain commands

'|' at the end of a command to enter another one ex --> du | sort -nr | less

### Archive and compress data

Archive and compress data the long way:

Step 1, put all the files you want to compress in the same folder: ex --> mv \*.txt folder/

Step 2, Create the tar file: tar -cvf my\_archive.tar folder/ -c : creates a .tar archive -v : tells you what is happening (verbose) -f : assembles the archive into one file Step 3.1, create gzip file (most current): gzip my\_archive.tar to decompress: gunzip my\_archive.tar.gz Step 3.2, or create a bzip2 file (more powerful but slow):

bzip2 my\_archive.tar to decompress: bunzip2 my archive.tar.bz2

**Basic Commands** 

#### Archive and compress data (continued)

step 4, to decompress the .tar file: tar -xvf archive.tar archive.tar

Archive and compress data the fast way:

- Show the content of .tar, .gz or .bz2 without decompressing it:

gzip:

#### tar:

tar -tf archive.tar

tar extra:

tar -rvf archive.tar file.txt = add a file to the .tar

You can also directly compress a single file and view the file without decompressing:

- Step 1, use gzip or bzip2 to compress the file: gzip numbers.txt
- Step 2, view the file without decompressing it: zcat = view the entire file in the console (same as cat) zmore = view one screen at a time the content of the file (same as more) zless = view one line of the file at a time (same as less)

#### Installing software

When software is available in the repositories: sudo apt-get install <nameOfSoftware> ex--> sudo apt-get install aptitude If you download it from the Internets in .gz format (or bz2) - "Compiling from source" Step 1, create a folder to place the file: mkdir /home/username/src <-- then cd to it</pre> Step 2, with 'ls' verify that the file is there (if not, mv ../file.tar.gz /home/username/src/) Step 3, decompress the file (if .zip: unzip <file>) <--Step 4, use 'ls', you should see a new directory Step 5, cd to the new directory Step 6.1, use 1s to verify you have an INSTALL file, then: more INSTALL If you don't have an INSTALL file: Step 6.2, execute ./configure <-- creates a makefile</pre> Step 6.2.1, run make <-- builds application binaries Step 6.2.2 : switch to root --> su Step 6.2.3 : make install <-- installs the software Step 7, read the readme file
