

Product Architecture

The background of the slide features several architectural blueprints and rolled-up drawings. The blueprints are spread out on a surface, showing various technical drawings, dimensions, and annotations. The rolled-up drawings are stacked on top of the blueprints, with some showing cross-sections and other technical details. The overall scene is in a light, monochromatic color palette, emphasizing the technical nature of the content.

Learning Objectives

1. Understand fundamentals of the product architecture development
2. Learn to apply fundamentals to develop a new product's architecture
3. Evaluate the product's architectural differences, features and limitations

What's Product Architecture?

Product architecture mainly deals with how a product is arranged into physical parts, components and assemblies.

It can be defined more precisely as:

1. The arrangement of functional elements.
2. The mapping from functional elements to physical components.
3. The specification of the interfaces between interacting physical components.

Modular Product Architecture

One Function → One Component

Integrated Product Architecture

One Function → Multiple Components
Multiple Functions → One Component

Your Opinion..?

Is one type of product architecture (modular vs. integral) better than the other?

- Performance
- Serviceability
- Sustainability
- Cost to develop
- Cost to manufacture
- Maintenance

Mixed Product Architecture

Steps to Define Product Architecture

1. Identify and list all possible functions essential to build a product
2. Understand the relation between those functions
3. Create a functional model/ diagram showing those relations
4. Create Clusters
5. Draw approximate product layouts or geometries
6. Identify mandatory or unintentional interactions between those functions

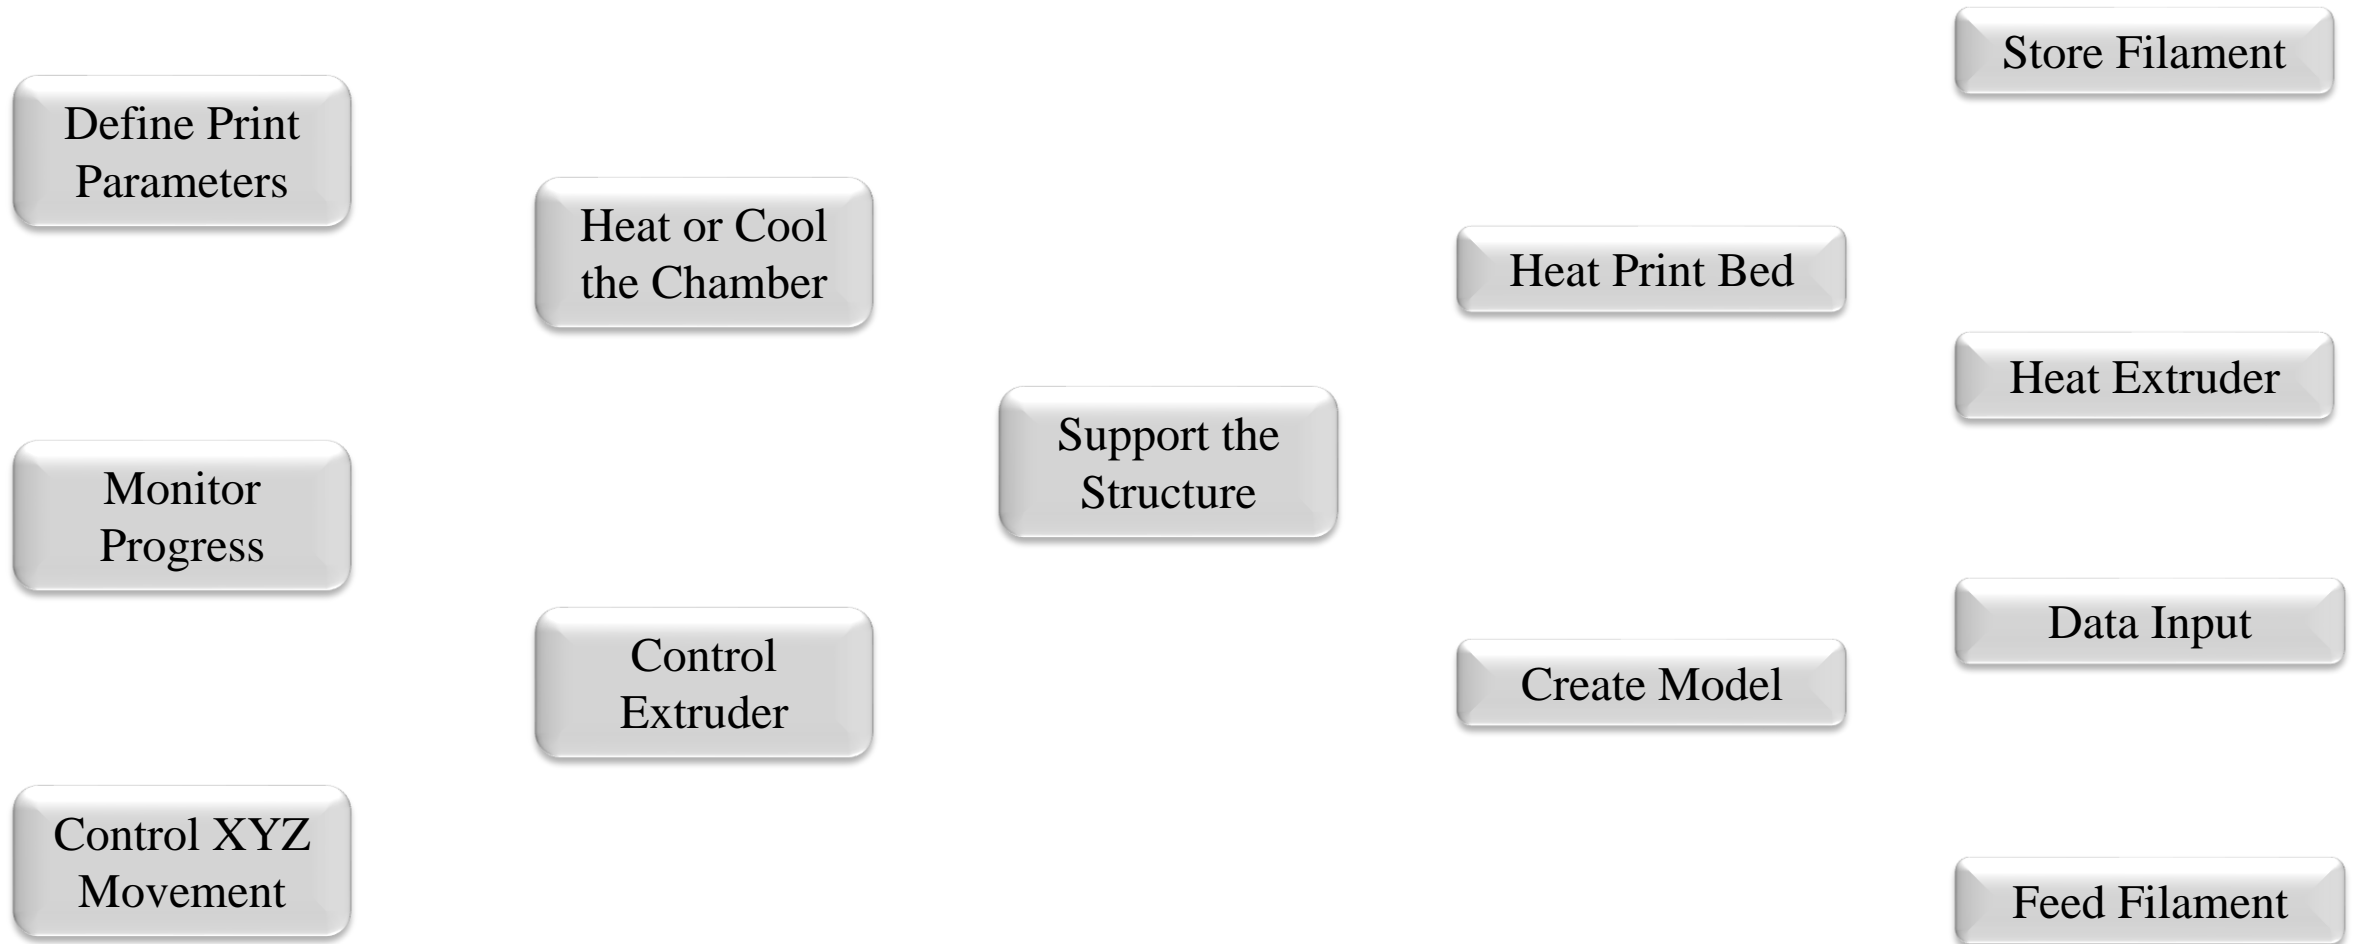

Practical Example

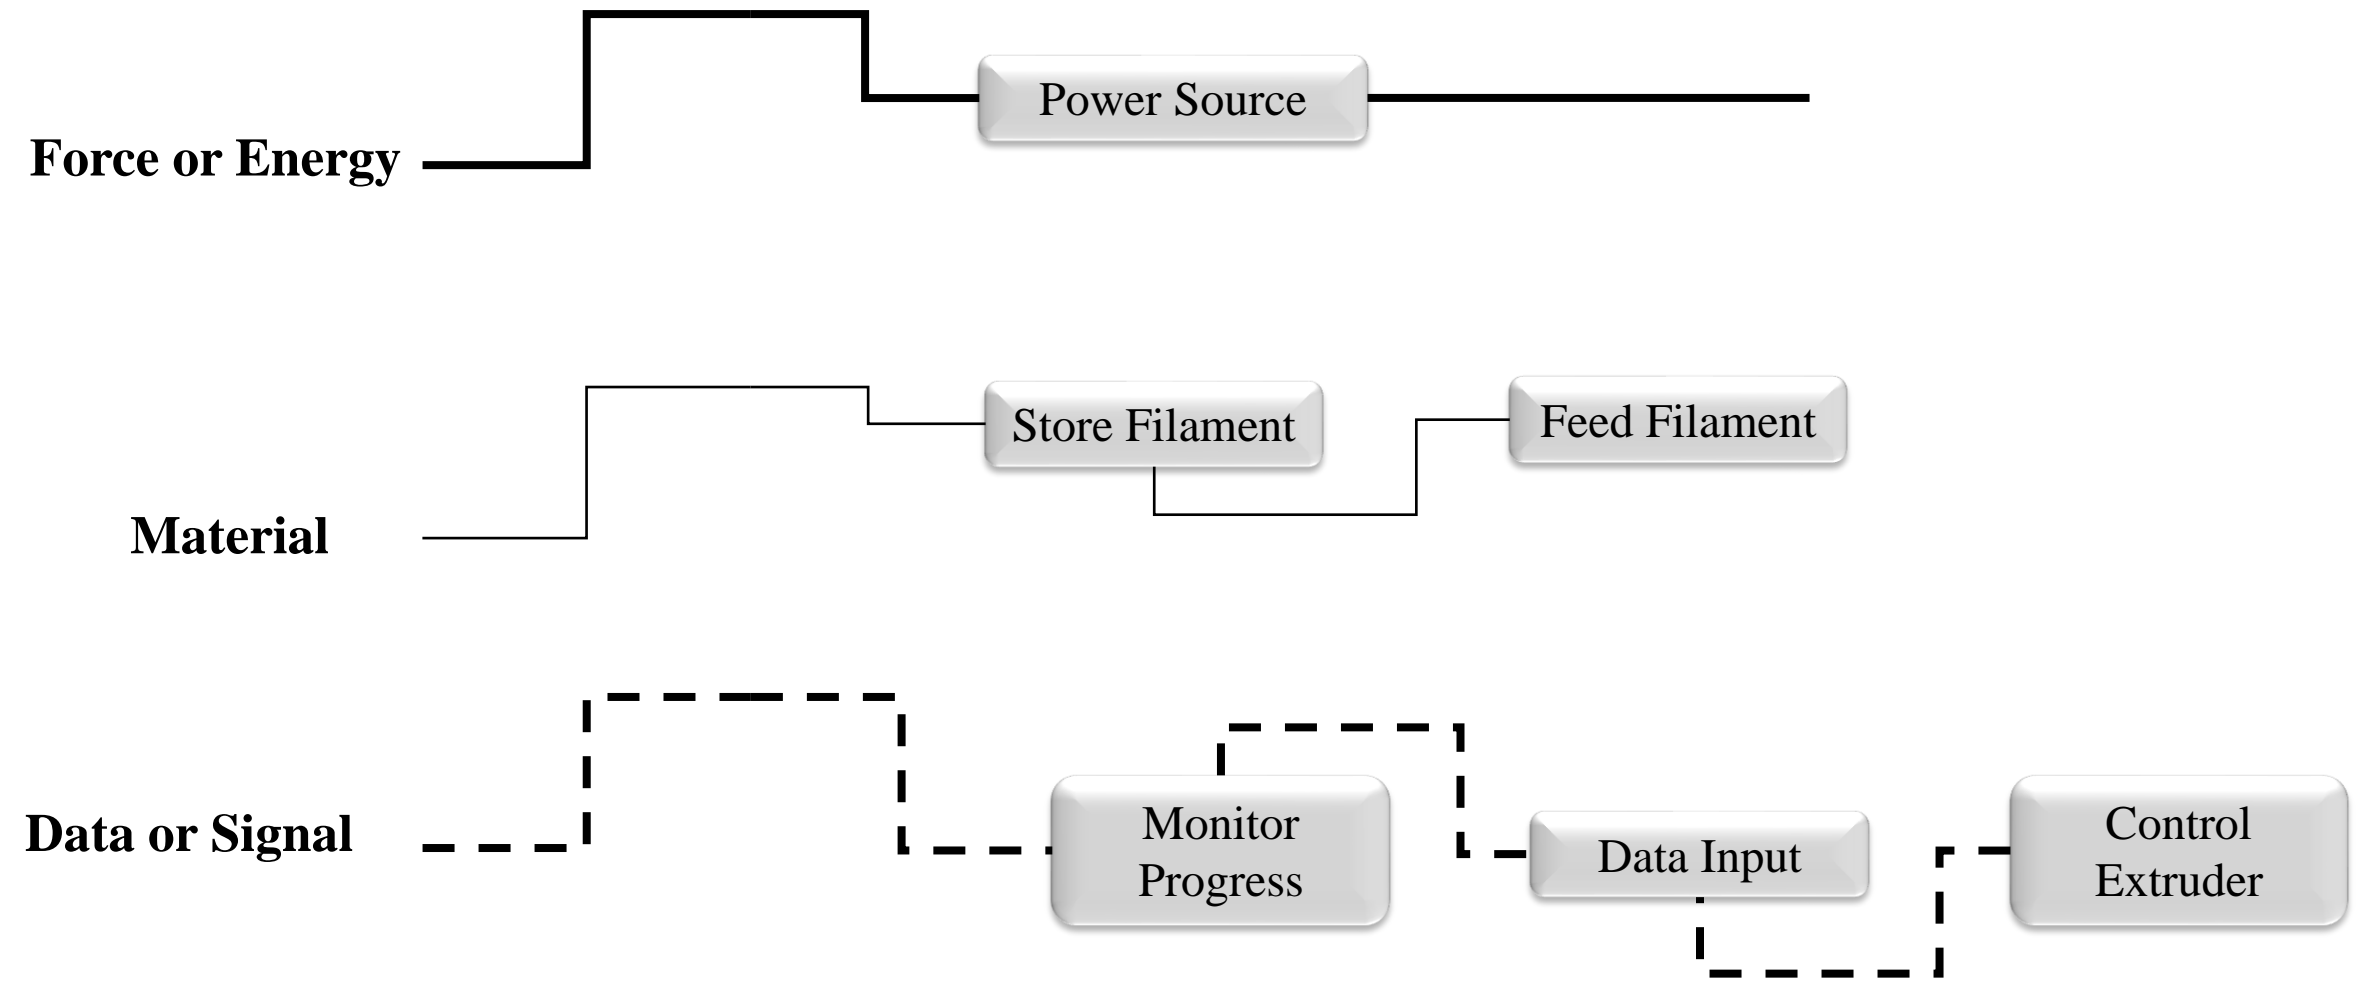

3D Printers

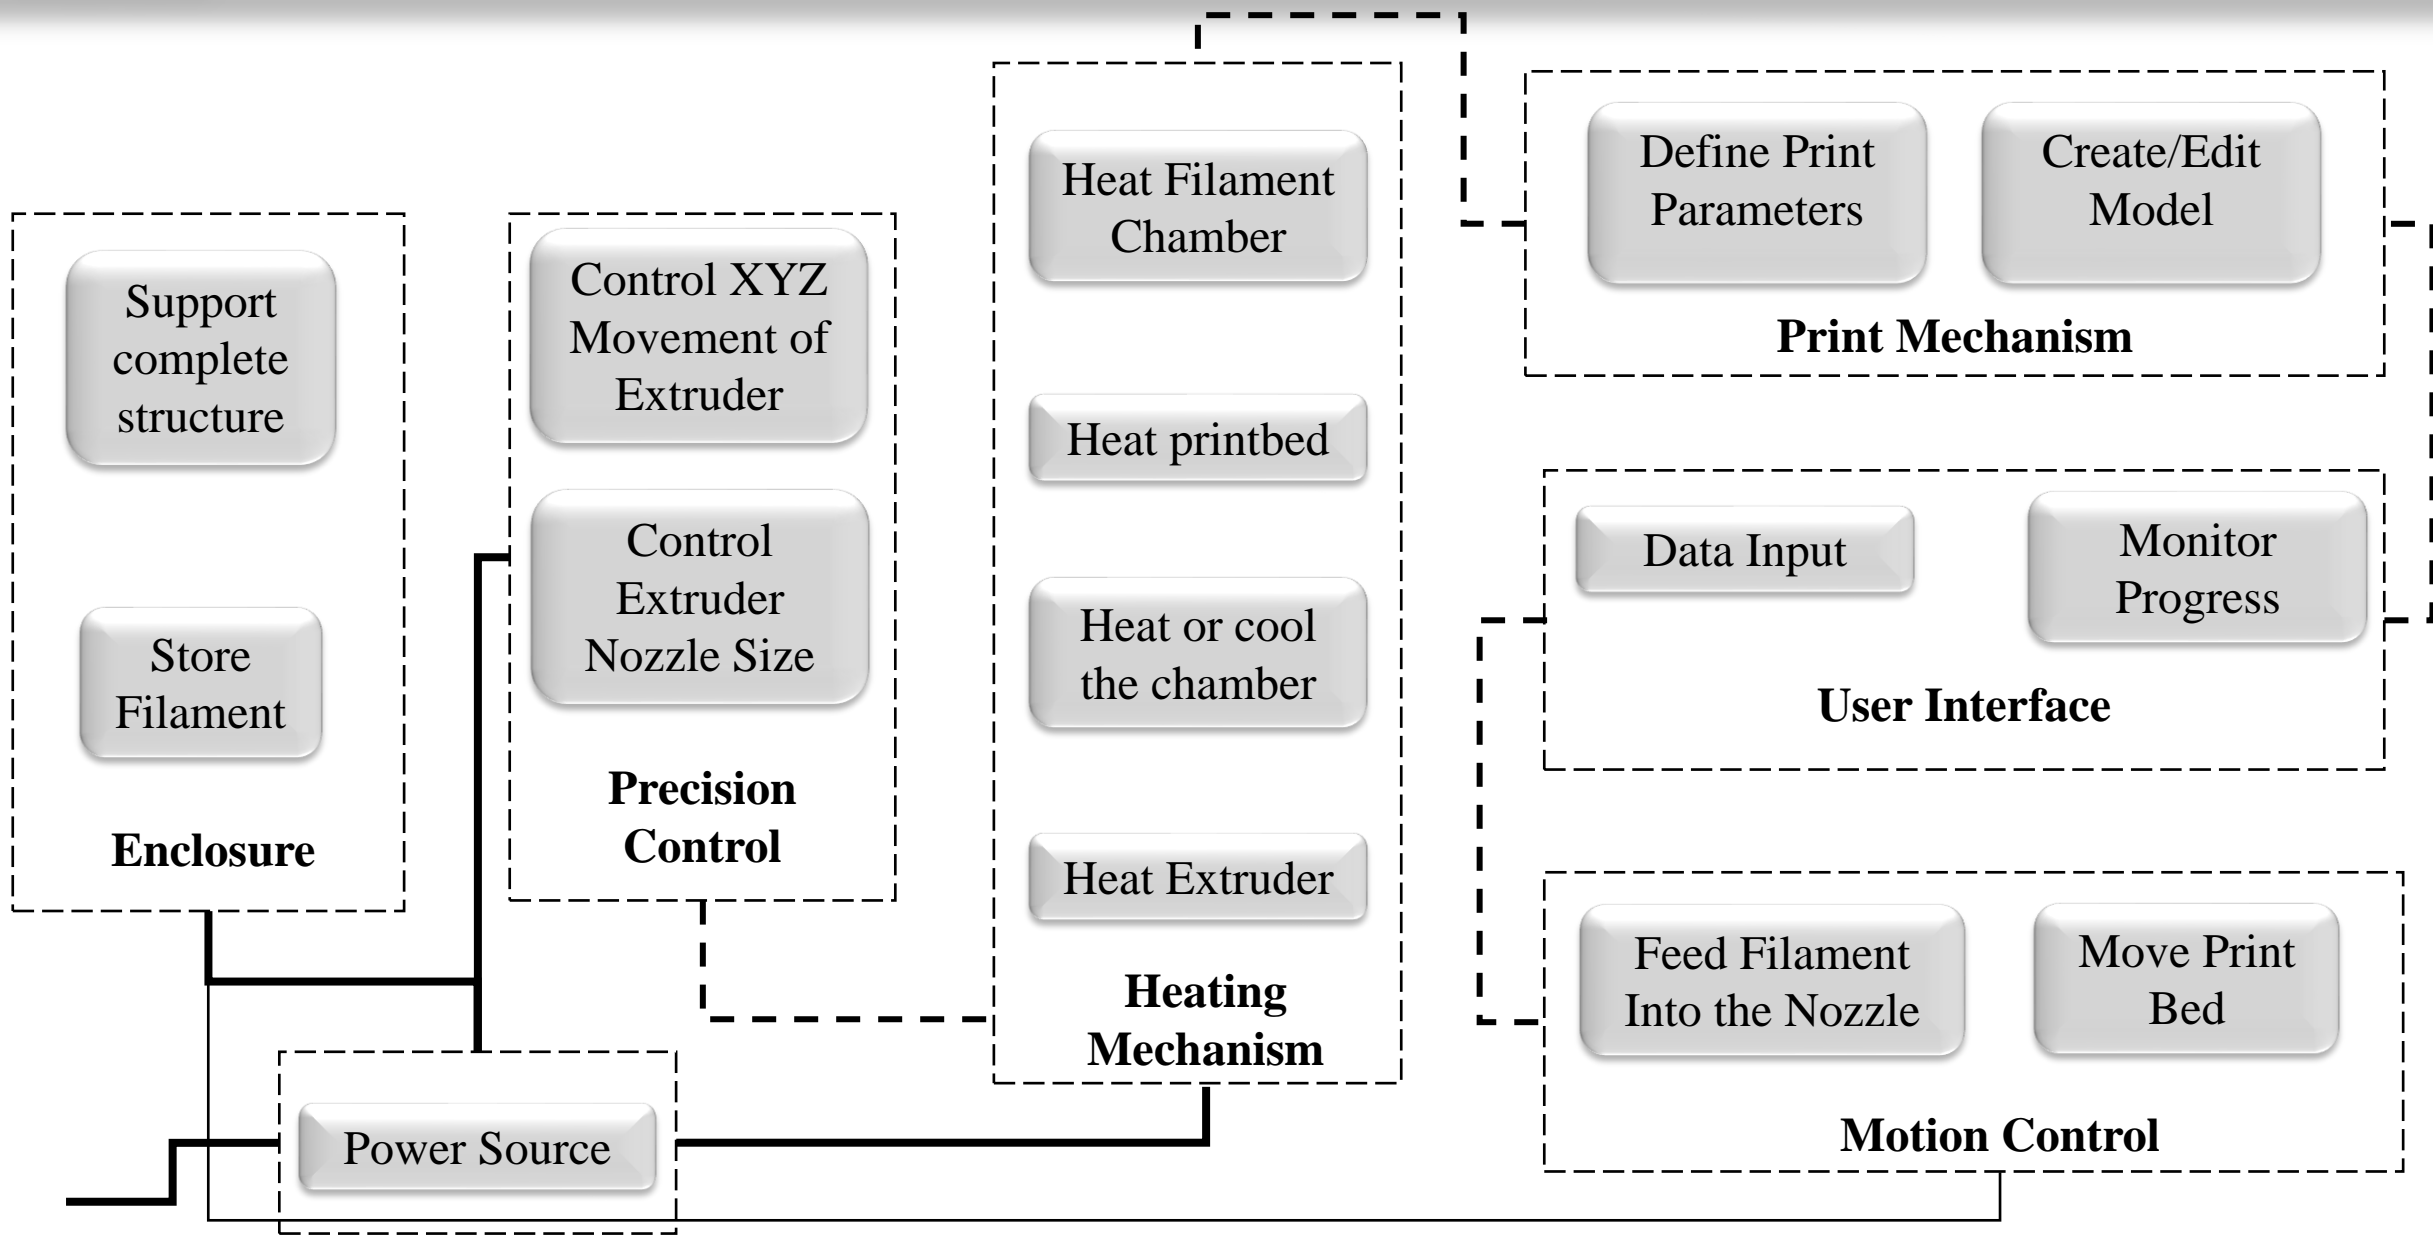

Functions Essential to Build a 3D Printer

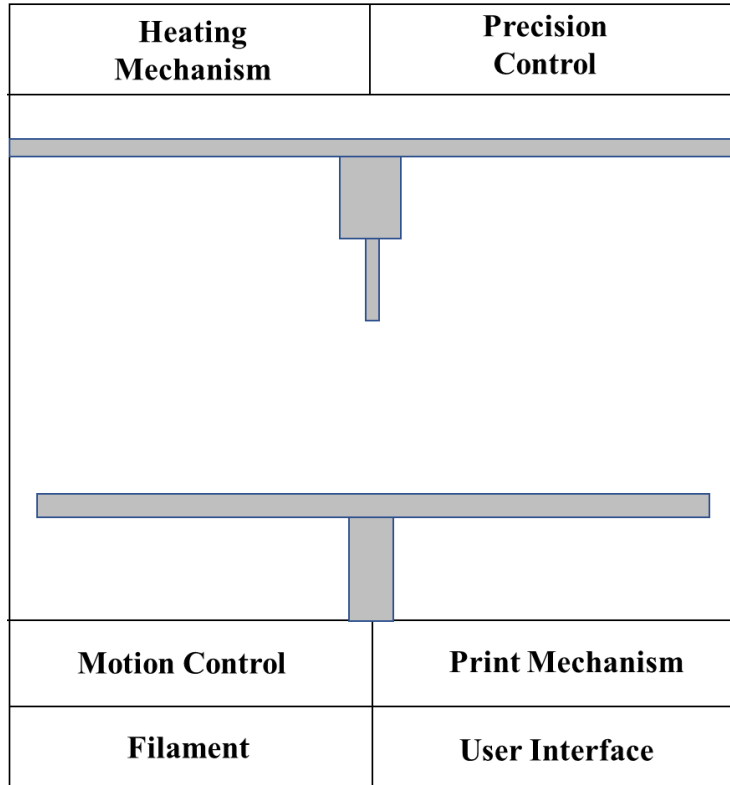

Relation Between Functions

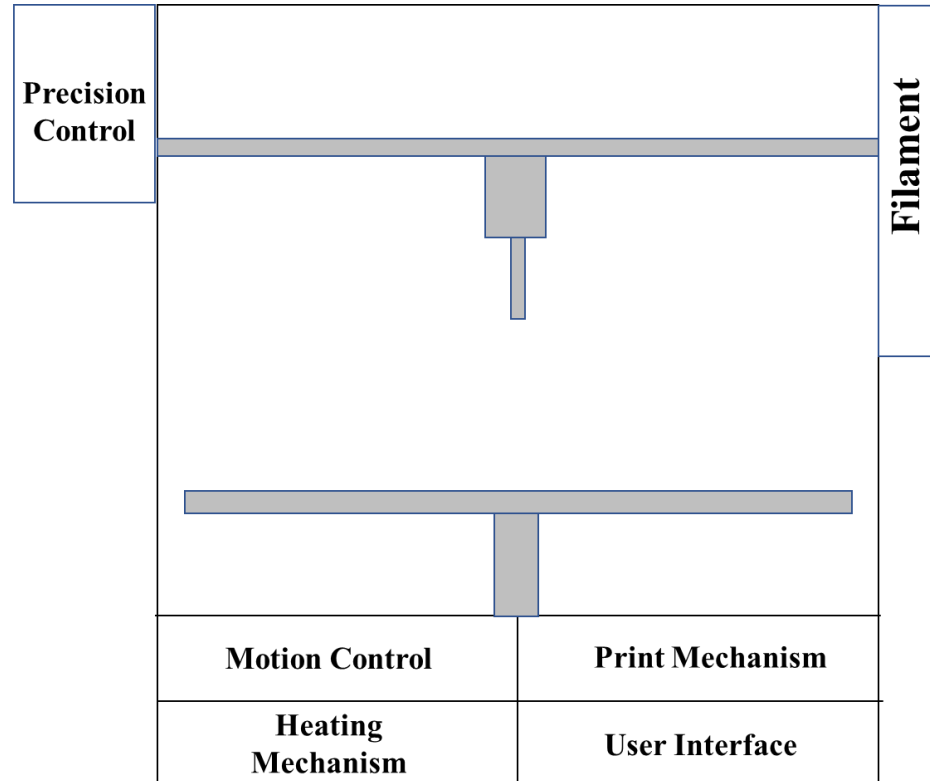

Chunks

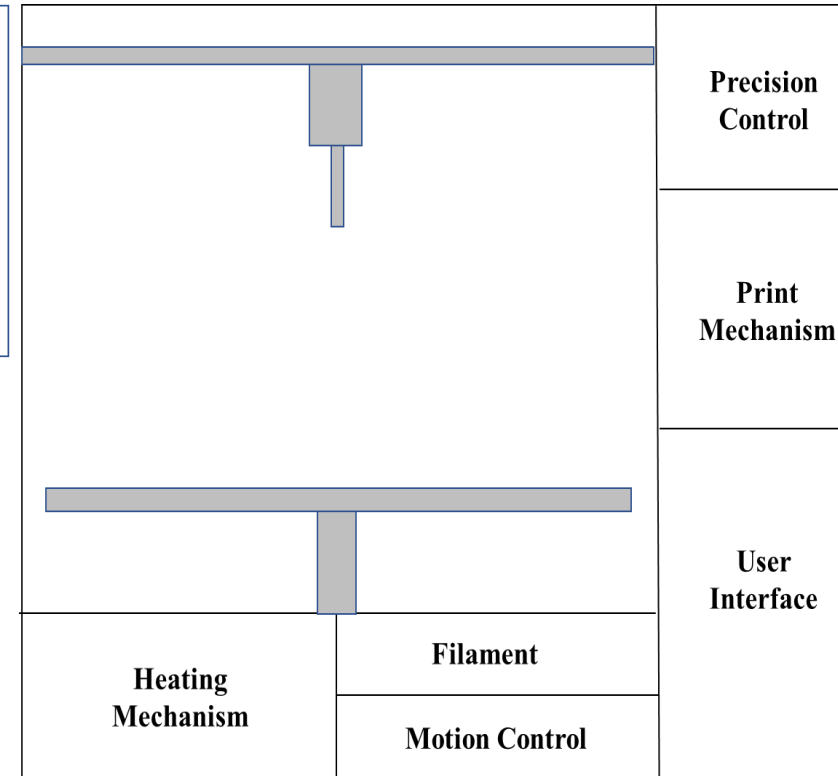

Geometric Layout 1

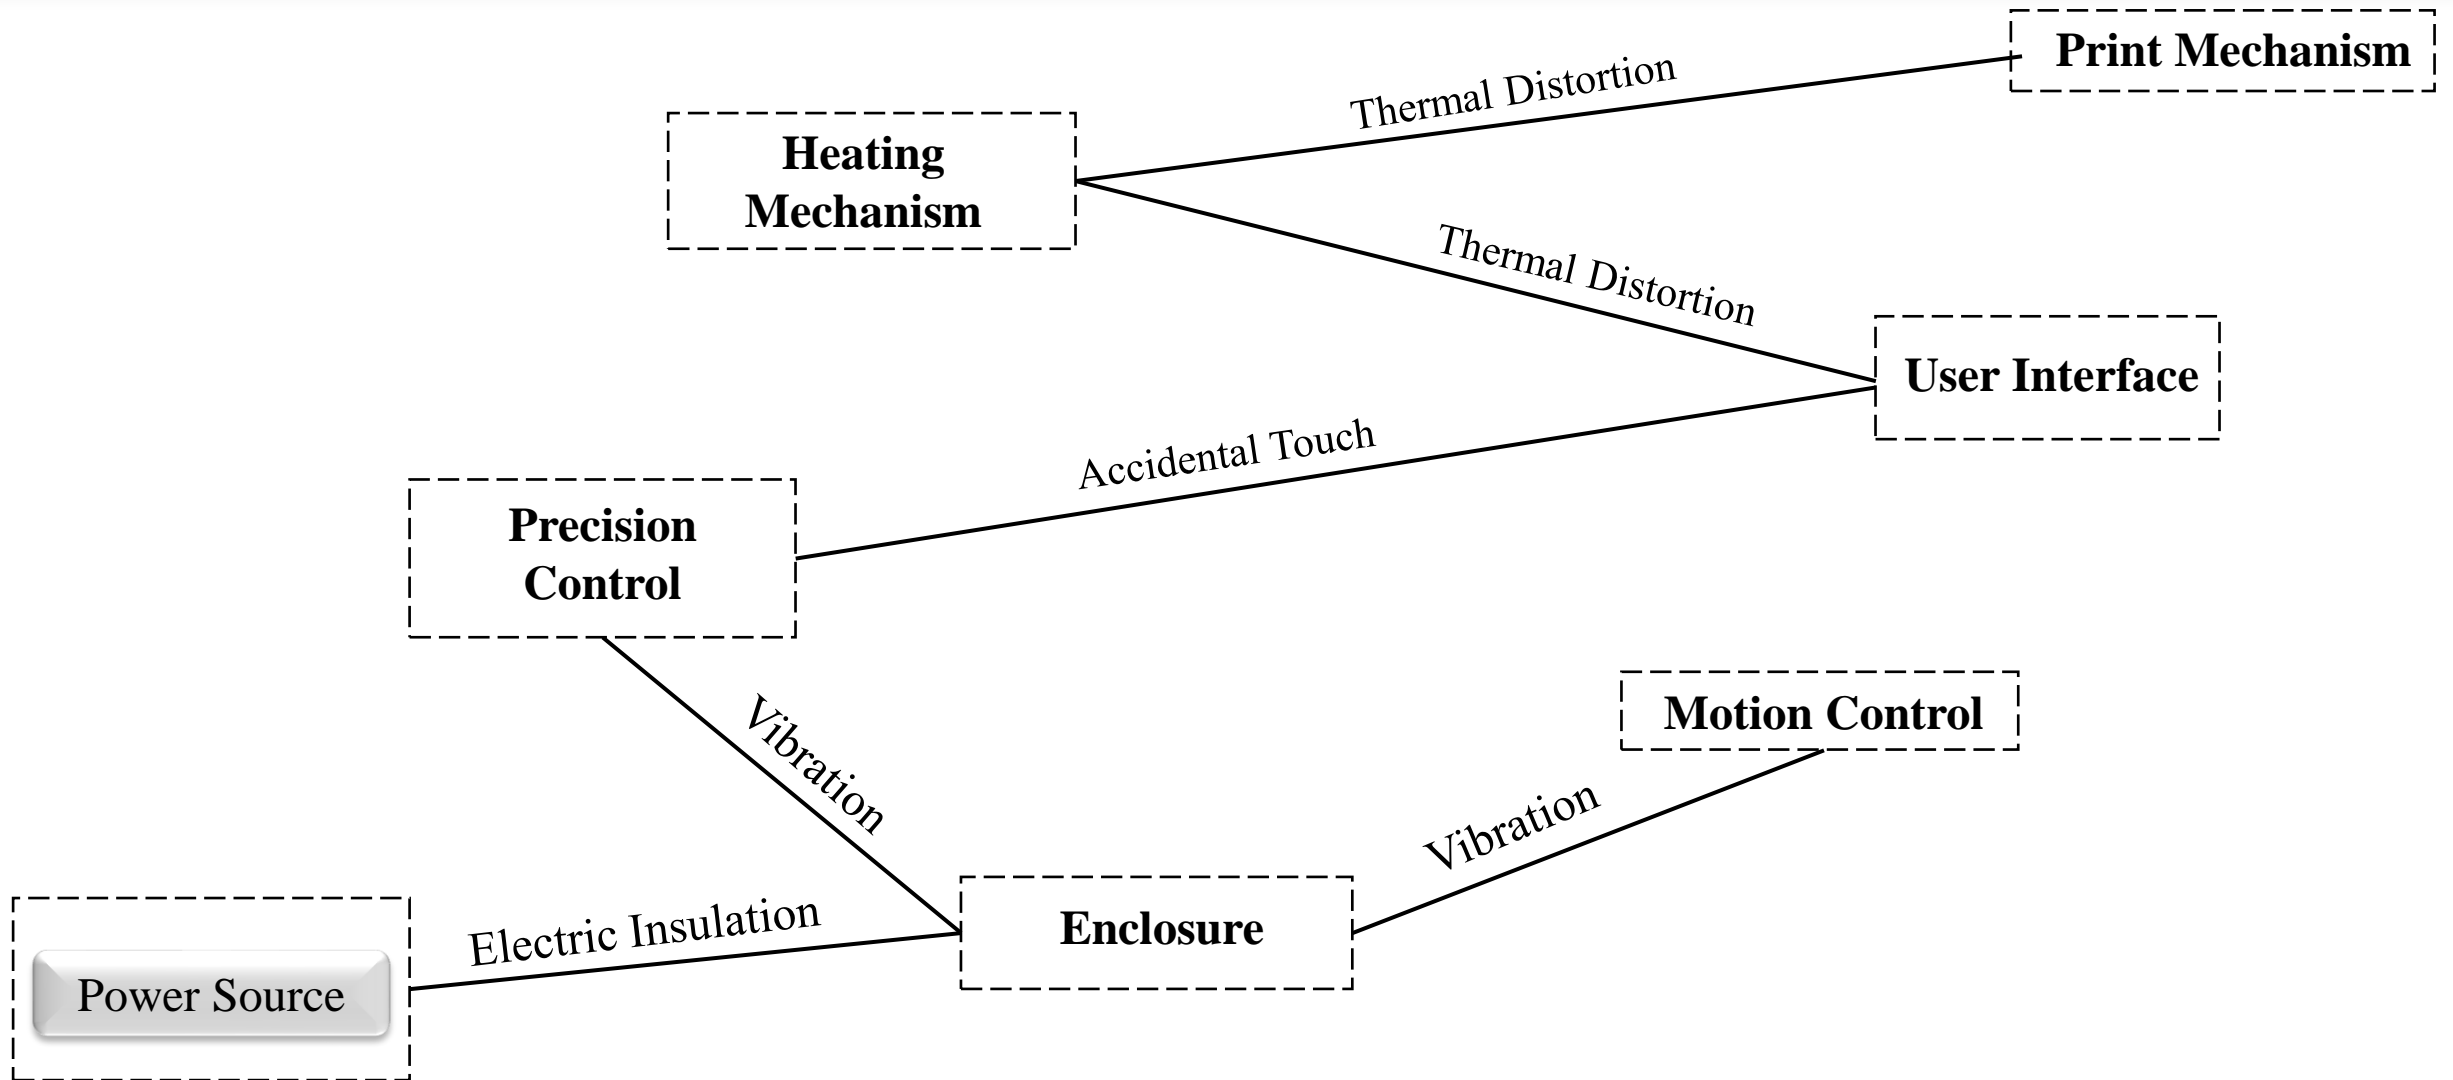

Geometric Layout 2

Geometric Layout 3

Interaction Graph

Pro Tips

Generally, we can group technical decisions into three categories

- ***Technical decisions that are easy to change:*** Type of material used, minor versions of software libraries, etc.
- ***Low-risk technical decisions which we probably don't need to change:***
Using Linux as OS or Android Based system etc.
- ***High-risk technical decisions:*** Buying storage for a local data center, deciding on a software language, a wireless protocol or a framework/platform, etc

Summary

- Architecture choices define the sub-systems and modules of the product platform or family.
- Architecture determines:
 - Ease of production variety
 - Feasibility of customer modification
 - System-level production costs
- Key Concepts:
 - Modular vs. Integral architecture
 - Clustering into chunks
 - Planning product families

Thank You!
