## 4. Theoretical exercises

## Demo exercises

Throughout these exercises, assume that $\mathbb{E}\left[x_{t-v} \epsilon_{t}\right]=0$ for all $v \geq 1$. In addition, assume that $\left(\epsilon_{t}\right)_{t \in T} \sim$ i.i.d. $\left(0, \sigma^{2}\right)$, such that $\sigma^{2}<+\infty$.
4.1 Consider the following $\mathrm{AR}(1)$ processes:

$$
\begin{align*}
& x_{t}=0.7 x_{t-1}+\epsilon_{t}  \tag{1}\\
& x_{t}=-0.5 x_{t-1}+\epsilon_{t} \tag{2}
\end{align*}
$$

(a) Show that both processes are (weakly) stationary.
(b) Using pen and paper, draw the auto- and partial autocorrelation functions that correspond to the process (2).

## Solution.

(a) $\operatorname{An} \operatorname{AR}(1)$ autoregressive process has the following lag polynomial representation: $\left(1-\phi_{1} L\right) x_{t}=\epsilon_{t}$. An ARMA process is stationary, if the zeros of the lag polynomial of the autoregressive part lie outside the closed unit disk. The lag polynomials are,

$$
\begin{array}{lll}
(1-0.7 L)=0 & \Rightarrow & L=10 / 7 \\
(1+0.5 L)=0 & \Rightarrow & L=-2
\end{array}
$$

Hence, both AR(1) processes are stationary.
(b) In the previous homework assignment, we derived the autocorrelation function for the $\mathrm{AR}(1)$ process:

$$
\rho(\tau)=\phi_{1}^{\tau} .
$$

Use this formula to draw the autocorrelation function. Note that the autocorrelation function decays exponentially. For example, when $\phi_{1}=-0.5$ :

$$
\rho_{0}=1, \quad \rho_{1}=-1 / 2, \quad \rho_{2}=1 / 4, \quad \rho_{3}=-1 / 8, \ldots
$$

Recall that the partial autocorrelation function of an $\operatorname{AR}(1)$ process cuts of after lag 1. Thus, it suffices to determine only the first partial autocorrelation. Hereby, the Yule-Walker equations give us directly that, $\alpha_{11}=\rho_{1}$.
4.2 Solve the partial autocorrelation $\alpha_{2}$ by using the Yule-Walker equations.

Solution. Denote $\alpha_{21}=\alpha_{1}$ ja $\alpha_{22}=\alpha_{2}$. The Yule-Walker equations give,

$$
\left(\begin{array}{cc}
1 & \rho_{1} \\
\rho_{1} & 1
\end{array}\right)\binom{\alpha_{1}}{\alpha_{2}}=\binom{\rho_{1}}{\rho_{2}} .
$$

Exercise 4.

The matrix equations produce the following,

$$
\left\{\begin{array}{l}
\alpha_{1}+\alpha_{2} \rho_{1}=\rho_{1} \\
\alpha_{1} \rho_{1}+\alpha_{2}=\rho_{2} .
\end{array}\right.
$$

By solving the upper equation for $\alpha_{1}$ and substituting the solution into the lower equation, we get that,

$$
\begin{aligned}
& \left(\rho_{1}-\alpha_{2} \rho_{1}\right) \rho_{1}+\alpha_{2}=\rho_{2} \\
& \Rightarrow \alpha_{2}=\frac{\rho_{2}-\rho_{1}^{2}}{1-\rho_{1}^{2}} .
\end{aligned}
$$

## Homework

4.3 We have simulated four time series using R. Figures 1-4 contain the trajectories, spectrum, autocovariance function and partial autocovariance function of the corresponding time series. Using Figures 1-4, choose the correct model from the choices given in Table 1. Justify your selection!

Table 1: Choose the correct process.

| Time series | Model candidates |
| :---: | ---: |
| 1 | $\operatorname{MA}(1), \operatorname{AR}(1)$ |
| 2 | $\operatorname{AR}(2), \operatorname{MA}(2), \operatorname{ARMA}(2,2)$ |
| 3 | $\operatorname{SMA}(1)_{12}, \operatorname{AR}(12), \operatorname{SAR}(1)_{12}$ |
| 4 | $\operatorname{SMA}(1)_{12}, \operatorname{MA}(12), \operatorname{SAR}(1)_{12}$ |

In Figures 1-3, the spectral density functions are calculated from the theoretical stochastic process. The corresponding autocorrelation functions and the partial autocorrelation functions are estimated from the observed time series.
