# **Chapter 8**

- · LQG control
- · Robustness of LQG control
- Loop transfer recovery (LTR)
- Introduction to Model Predictive Control
- Final steps in the course
- Course end

1

### Note:

LQG theory (Linear-Quadratic-Gaussian) means optimal (LQ) control with Gaussian noise disturbances present. The stochastic theory of continuous time systems is difficult.

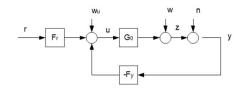

It is possible to present the theory in a "simplified" form, but that is omitted here. The important thing is to know that noise intensities (variance does not exist for continuous time stochastic signals) are mostly used as tuning parameters only. The optimal state estimator, Kalman filter, is used to estimate the states, which are fed back according to the LQ theory.

LQG = Kalman filter + LQ

3

### Chapter 8: *LQG*-control

$$z = Gu + w$$
  $u = F_r r - F_y y$   $e = z - r$   
 $y = z + n$ 

2

General state-space realization of the process is

$$\dot{x} = Ax + Bu + Nv_1$$

$$z = Mx$$

$$y = Cx + v_2$$

and the criterion

$$\min \left( \|e\|_{Q_{1}}^{2} + \|u\|_{Q_{2}}^{2} \right) = \min \int \left[ e^{T}(t)Q_{1}e(t) + u^{T}(t)Q_{2}u(t) \right] dt$$

$$e = z - r$$

Consider the *regulator problem* (r = 0)

$$\dot{x} = Ax + Bu + Nv_1$$
$$z = Mx$$

$$y = Cx + v_2$$

white noise 
$$\begin{bmatrix} v_1 \\ v_2 \end{bmatrix}$$
 with intensity  $\begin{bmatrix} R_1 & R_{12} \\ R_{12}^T & R_2 \end{bmatrix}$ 

Determine

$$u(t) = -F_y(p)y(t)$$
 such that

$$V = ||z||_{Q_1}^2 + ||u||_{Q_2}^2$$
 is minimized

5

and the state feedback coefficient L

$$L = Q_2^{-1} B^T S$$

where S is the solution to the stationary Riccati equation (LQ)

$$A^{T}S + SA + M^{T}Q_{1}M - SBQ_{2}^{-1}B^{T}S = 0$$

(symmetric and positive semidefinite solution)

(Note that only infinite optimization horizons are considered here, so that the stationary Riccati equations can be used.)

7

**Solution** (without proof): Let (A,B) be stabilizable and (A,C) detectable.

The optimal control law is

$$u(t) = -L\hat{x}(t)$$

$$\dot{\hat{x}}(t) = A\hat{x}(t) + Bu(t) + K[y(t) - C\hat{x}(t)]$$

in which the Kalman gain K is obtained by the Riccati equation

$$AP + PA^{T} + NR_{1}N^{T} - (PC^{T} + NR_{12})R_{2}^{-1}(PC^{T} + NR_{12})^{T} = 0$$

$$K = (PC^{T} + NR_{12})R_{2}^{-1}$$

6

The solution has the *separation property*: the optimal state observer and optimal state feedback can be designed independent of each other. The whole solution is then the "combination" of these.

If the states are measurable, y = x, the Kalman-filter is not needed and the state feedback is formed directly from the state.

The theory guarantees that the resulting closed-loop system is stable.

Terms: LQ (linear quadratic) LQG (linear quadratic gaussian) ARE (algebraic Riccati equation) (Separation principle)

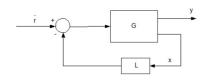

Matlab:

kalman, estim lqgreg lqr, dlqr lqe, dlqe lqrd sigma, dsigma

9

### Robustness of LQ/LQG-controllers

LQ: u(t) = -Lx(t) $\dot{x}(t) = Ax(t) + Bu(t)$ 

The loop transfer function (gain in control signal)

$$G_k(s) = L(sI - A)^{-1}B$$

But how about the robustness of the LQ(LQG) – controller?

$$e = (I - G_c)r - Sw + Tn$$
  
$$u = G_{rr}r + G_{wr}(w + n)$$

### Not necessarily very good!

The weight matrices and noise intensities can be thought to be tuning parameters in control design.

After design the frequency domain analysis and simulations must be carried out to verify the performance of the controller. Next, consider robustness a bit closer.

10

But in that transfer function

$$H(s) = L(sI - A)^{-1} B$$

L is determined from the equations

$$L = Q_2^{-1}B^T S$$
  
  $A^T S + SA + Q_1 - SBQ_2^{-1}B^T S = 0$ 

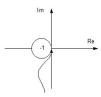

and now it holds (apply the lemma 5.2 in the textbook)

$$[I + H(-i\omega)]^{T} Q_{2}[I + H(i\omega)] \ge Q_{2}$$

which in SISO-case is

$$|1+H(i\omega)| \ge 1$$

That means that the Nyquist curve will never go inside the circle shown in the figure:

- -phase margin at least 60 degrees
- -gain margin infinite
- -the magnitude of the sensitivity function is less than one
- -the magnitude of the complementary sensitivity function is smaller than two.

Engineering

13

looked from the output or input side of the process . ( For *SISO*-systems the functions are the same.)

But now the good robustness properties do not necessarily hold, even though K and L have been chosen according to the LQG-formulas (the phase margin can even be arbitrarily small).

An idea to fix that problem: let L be chosen as above. Can K be chosen such that

$$F_y G = L(sI - A + BL + KC)^{-1} KC(sI - A)^{-1} B \approx L(sI - A)^{-1} B$$

which would make it possible to enjoy the "ideal" loop transfer function again.

1

LQG:  $u(t) = -L\hat{x}(t) + \tilde{r}(t)$  $p\hat{x}(t) = A\hat{x}(t) + Bu(t) + K\left[y(t) - C\hat{x}(t)\right]$ It follows  $u(t) = -F_y(p)y(t) + F_r(p)\tilde{r}(t)$  $F_y(p) = L\left(pI - A + BL + KC\right)^{-1}K$  $F_r(p) = I - L\left(pI - A + BL + KC\right)^{-1}B$ 

and the loop gains are

$$GF_y = C(sI - A)^{-1}BL(sI - A + BL + KC)^{-1}K$$
  
 $F_yG = L(sI - A + BL + KC)^{-1}KC(sI - A)^{-1}B$ 

14

Result: Yes, it is possible by choosing

$$K = \rho B$$

where  $\rho$  is large enough. That holds generally and also in MIMO case; the number of inputs and outputs must be the same.

This technique is called the **loop transfer recovery** (*LTR*).

The idea is to calculate L as the solution to the optimal control problem and then change K as described above. (To increase  $\rho$  until the desired sensitivity functions are obtained.) But there is no guarantee that the filter remains stable.

16

Use another procedure to aim at  $K = \rho B$ 

$$\dot{x} = Ax + Bu + Nv_1$$

$$z = Mx$$

$$y = Cx + v_2$$

$$K = PC^T R_2^{-1}$$

$$PA^T + AP - PC^T R_2^{-1}CP + NR_1N^T = 0$$
(Kalman)

Choose

$$R_1 = \alpha R_2$$
,  $N = B$   $\alpha$  being "large". Then 
$$PA^T + AP - KR_2K^T + \alpha BR_2B^T = 0$$

# **Model Predictive Control (MPC)**

### Literature:

- Wang, L, Model Predictive Control System Design and Implementation Using MATLAB, Springer, 2009.
- Maciejowski, J. M., Predictive Control, with Constraints, Pearson Education, 2002.
- Rawlings, J. B., and Mayne, D. Q., Model Predictive Control Theory and Design, Nob Hill, 2009.

Aalto University
School of Electrical
Engineering

19

where the last two terms dominate, as  $\alpha$  grows. Hence

$$K \approx \sqrt{\alpha}B$$

holds, and also the Kalman-filter remains Ok.

Now the tuning parameters were N,  $R_1$  and  $R_2$ .

Note. The presented method was *input-LTR*, because the loop transfer function was  $F_yG$  (gain of the input signal)

There exists also an *output-LTR* method based on  $GF_y$ . In *SISO*-case the two methods are the same.

Aalto University
School of Electrical
Engineering

Remark 1.1. Note that a number of control methods which have gained popularity in industry, such as fuzzy control and neural control, do not explicitly address any of the fundamental control issues in a quantitative way at all. This is the main reason why control people do not usually take these methods scriously. Naturally, these methods will still often work at least in not too demanding applications. They also appeal to many people with a non-control background and their functioning can more easily be explained to process operators and the media.

21

# The main characteristics in MPC

- · An internal model capable of fast simulation
- A reference trajectory which defines the desired closed-loop behaviour
- The *receding horizon* principle
- Future input trajctory by a finite number of control moves
- On-line optimization (possibly constrained)

Aalto University
School of Science
and Technology

## **Model Predictive Control**

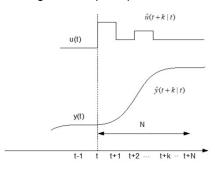

- Can deal with constraints in a natural way
- · The basic idea is easy to understand
- It extends to multivariable plants naturally
- · Generally more powerful than traditional PID control
- Integrates optimal control, stochastic control, control of processes with dead-time, multivariable control, control that can handle constraints.
- A practical methodology, which has numerous technical applications, especially in the process industry.
- It was earlier neglected and critisized by the control engineering community (lack of stability proofs, robustness etc.); this situation has changed due to progress in theory.

22

# Model Predictive Control Reference trajectory Predicted outputs Model Predicted outputs Optimizer Future errors Cost function Allato University School of Science and Technology

### The Receding horizon principle

The output is predicted over the *prediction horizon*. Control *moves* are calculated over the *control horizon* by optimizing a criterion. Only the first move is realized; then the process is repeated.

25

# Model predictive control (MPC)

- Note that there are different formalisms to pose the MPC problem.
- Also, there exist software packages to do the job.
   The problem in using software packages "blindly" is the lack of insight and analysis possibilities.
- For example: Matlab's MPC toolbox is good in posing and solving problems at a reasonably high level. It is somewhat difficult to use it in research though.
- It is good to make one formalism yourself to get insight.
   The software packages then become easier to deal with.

Aalto University
School of Science
and Technology

27

- A lot of different formulations can be found in the literature (MPHC, MAC, DMC, EHAC, EPSAC, GPC etc. etc.)
- Maciejowski's book has information on commercial MPC products, e.g. DMCPlus, RMPCT, Connoisseur, PFC, HIECON, 3dMPC, Process Perfecter.

Aalto University
School of Science
and Technology

26

### Cost function

$$V(k) = \sum_{i=H_{-}}^{H_{p}} \left\| \hat{z}(k+i|k) - r(k+i|k) \right\|_{Q(i)}^{2} + \sum_{i=0}^{H_{p}-1} \left\| \Delta \hat{u}(k+i|k) \right\|_{R(i)}^{2}$$

Prediction horizon  $H_p$  , Q(i), R(i) positive semidefinite Control horizon  $H_u$ 

Control move  $\Delta u$  it is assumed that the penalty is on the control moves, not controls as such

Note that if  $H_{w} > 1$  there is no penalty immediately at time k.

The states are usually not measurable; instead we have predictions  $\hat{x}(k+1|k)$  meaning that we estimate the state by using data up to time k.

Aalto University
School of Science
and Technology

### Features of constrained predictive control

- Constraints cause MPC be nonlinear. But most of the time (when constraints are not near to be active) the controller operates in a linear way.
- In practice, meeting a hard constraint can be dangerous for the system. An MPC might do hazardous actions (in "panic"); usually a supervisory mode is used to prevent such actions.
- We consider only time-invariant MPC. The system has then constant coefficient matrices. In

$$V(k) = \sum_{i=H_{\nu}}^{H_{p}} \left\| \hat{z}(k+i | k) - r(k+i | k) \right\|_{\mathcal{Q}(i)}^{2} + \sum_{i=0}^{H_{u}-1} \left\| \Delta \hat{u}(k+i | k) \right\|_{\mathcal{Z}(i)}^{2}$$

Q(i) and R(i) can vary with i, but they must not change with k

29

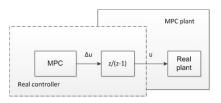

# Prediction

- Predictions of the controlled variables 
   \$\hat{z}(k+i|k)\$ must be obtained to solve the control problem. They are based on the best estimates of \$\hat{x}(k|k)\$ and the assumed future inputs (or the latest input \$u(t-1)\$)
- The predictor can be seen as a "tuning parameter" in the MPC problem, because it plays a key role in the performance of the controller.
- We are actually specifying a model of the environment in which the plant is operating
- Assuming that the states are measurable and there are *no disturbances* we get

### Alternative state variable choices

• Usually the MPC gives the *control move* as its output, whereas the project model uses absolute values. The *integration* in the state space model is then needed (to create u from  $\Delta u$ 

Aalto University
School of Science
and Technology

30

### **Prediction**

$$\hat{x}(k+1|k) = Ax(k) + B\hat{u}(k|k)$$

$$\hat{x}(k+2|k) = A\hat{x}(k+1|k) + B\hat{u}(k+1|k) = A^{2}x(k) + AB\hat{u}(k|k) + B\hat{u}(k+1|k)$$

$$\vdots$$

$$\hat{x}(k+H_{p}|k) = A\hat{x}(k+H_{p}-1|k) + B\hat{u}(k+H_{p}-1|k)$$

$$= A^{H_{p}}x(k) + A^{H_{p}-1}B\hat{u}(k|k) + \dots + B\hat{u}(k+H_{p}-1|k)$$

But  $\hat{u}(k+i|k) = \hat{u}(k+H_u-1|k)$ ,  $H_u \le i \le H_p-1$  and earlier control moves will be studied only. So  $\hat{u}(k|k) = \Delta \hat{u}(k|k) + u(k-1)$ 

$$\begin{split} \hat{u}(k+1|k) &= \Delta \hat{u}(k+1|k) + \Delta \hat{u}(k|k) + u(k-1) \\ &\vdots \\ \hat{u}(k+H_u-1|k) &= \Delta \hat{u}(k+H_u-1|k) + \ldots + \Delta \hat{u}(k|k) + u(k-1) \end{split}$$

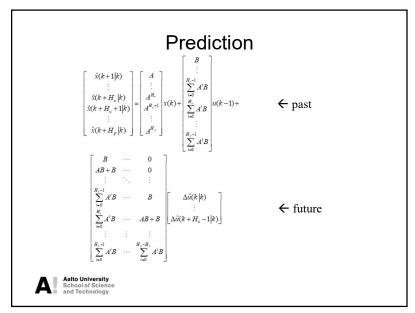

# **Prediction**

· Hence we get

$$\begin{split} \hat{x}(k+1|k) &= Ax(k) + B\Big[\Delta \hat{u}(k|k) + u(k-1)\Big] \\ \hat{x}(k+2|k) &= A^2x(k) + AB\Big[\Delta \hat{u}(k|k) + u(k-1)\Big] + B\Big[\Delta \hat{u}(k+1|k) + \Delta \hat{u}(k|k) + u(k-1)\Big] \\ &= A^2x(k) + (A+I)B\Delta \hat{u}(k|k) + B\Delta \hat{u}(k+1|k) + (A+I)Bu(k-1) \\ \vdots \\ \hat{x}(k+H_u|k) &= A^{H_u}x(k) + (A^{H_u-1} + \ldots + A+I)B\Delta \hat{u}(k|k) \\ & \ldots + B\Delta \hat{u}(k+H_u-1|k) + (A^{H_u-1} + \ldots + A+I)Bu(k-1) \end{split}$$

Aalto University
School of Science
and Technology

33

Prediction

$$\begin{split} \hat{x}(k+H_u+1\big|k) &= A^{H_u+1}x(k) + (A^{H_u}+\ldots+A+I)B\Delta\hat{u}(k\big|k) \\ &\qquad \ldots + (A+I)B\Delta\hat{u}(k+H_u-1\big|k) + (A^{H_u}+\ldots+A+I)Bu(k-1) \\ \vdots \\ \hat{x}(k+H_p\big|k) &= A^{H_p}x(k) + (A^{H_p-1}+\ldots+A+I)B\Delta\hat{u}(k\big|k) \\ &\qquad \ldots + (A^{H_p-H_u}+\ldots+A+I)B\Delta\hat{u}(k+H_u-1\big|k) + (A^{H_p-1}+\ldots+A+I)Bu(k-1) \end{split}$$

We can collect everything in a matrix-vector form

Aalto University
School of Science
and Technology

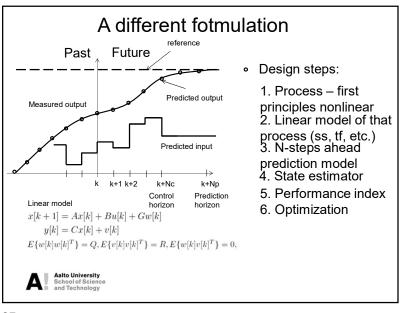

34

### Prediction

• The predictions are now obtained simply as

$$\begin{bmatrix} \hat{z}(k+1|k) \\ \vdots \\ \hat{z}(k+H_p|k) \end{bmatrix} = \begin{bmatrix} C_z & 0 & \cdots & 0 \\ 0 & C_z & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & C_z \end{bmatrix} \begin{bmatrix} \hat{x}(k+1|k) \\ \vdots \\ \hat{x}(k+H_p|k) \end{bmatrix}$$

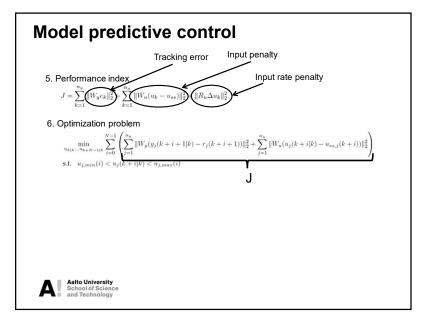

Aalto University
School of Science
and Technology

Model predictive control

3. N-steps ahead prediction model  $\begin{bmatrix} x_{k+1|k} \\ x_{k+2|k} \\ \vdots \\ x_{k+N|k} \end{bmatrix} = \begin{bmatrix} A \\ A^B \\ A^B \\ A^B \\ \vdots \\ A^{N-1}B \\ A^{N-2}B \\ A^{N-2}B$ 

37

To continue:

- Read chapters 1 and 2 in Wang's book to become convenient with one formalism.
- The rest of Wang's book is interesting and useful. To continue studies in MPC, I would start from it.

Aalto University
School of Science
and Technology

38

# The formalism in Wang's book

Process model

$$\dot{x}_m(t) = Ax_m(t) + Bu(t)$$
$$y(t) = Cx_m(t)$$

Discretized form

$$x_m(k+1) = A_m x_m(k) + B_m u(k)$$
$$y(k) = C_m x_m(k)$$

Form the difference

$$x_m(k+1) - x_m(k) = A_m \left[ x_m(k) - x_m(k-1) \right] + B_m \left[ u(k) - u(k-1) \right]$$

41

and finally to

$$\begin{bmatrix} \Delta x_m^{x(k+1)} \\ y(k+1) \end{bmatrix} = \begin{bmatrix} A_m & o_m^T \\ C_m A_m & 1 \end{bmatrix} \begin{bmatrix} \Delta x_m^{x(k)} \\ y(k) \end{bmatrix} + \begin{bmatrix} B_m \\ C_m B_m \end{bmatrix} \Delta u(k)$$

$$y(k) = \begin{bmatrix} o_m^c & 1 \end{bmatrix} \begin{bmatrix} \Delta x_m(k) \\ y(k) \end{bmatrix}; \quad o_m = \begin{bmatrix} 0 & 0 \end{bmatrix}^{m_1} \cdots 0$$

Now, remember

$$\begin{bmatrix} y_{k+1|k} \\ y_{k+2|k} \\ \vdots \\ y_{k+N|k} \end{bmatrix} = \begin{bmatrix} CA \\ CA^2 \\ \vdots \\ CA^N \end{bmatrix} x_k + \begin{bmatrix} CB & 0 & \cdots & 0 \\ CAB & CB & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ CA^{N-1}B & CA^{N-2}B & \cdots & CB \end{bmatrix} \begin{bmatrix} u_{k|k} \\ u_{k+1|k} \\ \vdots \\ u_{k+N|k} \end{bmatrix}$$

or

$$Y = Fx(k_i) + \Phi \Delta U$$

and define the variables

$$\Delta x_m(k+1) = x_m(k+1) - x_m(k)$$
  

$$\Delta x_m(k) = x_m(k) - x_m(k-1)$$
  

$$\Delta u(k) = u(k) - u(k-1)$$

It follows that

$$\Delta x_m(k+1) = A_m \Delta x_m(k) + B_m \Delta u(k)$$

Denote  $x(k) = \begin{bmatrix} \Delta x_m^T(k) & y(k) \end{bmatrix}^T$  which leads first to

$$y(k+1) - y(k) = C_m \left[ x_m(k+1) - x_m(k) \right] = C_m \Delta x_m(k+1)$$
  
=  $C_m A_m \Delta x_m(k) + C_m B_m \Delta u(k)$ 

42

Written generally in the MIMO case

$$\underbrace{\begin{bmatrix} \Delta \mathbf{x}(k+1) \\ \mathbf{y}(k+1) \end{bmatrix}}_{x_a(k+1)} = \underbrace{\begin{bmatrix} A & \mathbf{o}_{n_s \times n_y} \\ CA & \mathbb{1}_{n_y \times n_y} \end{bmatrix}}_{A_a} \underbrace{\begin{bmatrix} \Delta \mathbf{x}(k) \\ \mathbf{y}(k) \end{bmatrix}}_{x_a(k)} + \underbrace{\begin{bmatrix} B \\ CB \end{bmatrix}}_{B_a} \Delta u(k)$$

$$y(k) = \left[ o_{n_x \times n_y} \, \mathbb{1}_{n_y \times n_y} \right] \underbrace{\left[ \underbrace{\Delta x(k)}_{y(k)} \right]}_{C_x}$$

$$Y = [y(k_i + 1|k_i) \ y(k_i + 2|k_i) \dots y(k_i + N_p|k_i)]$$
  
$$\Delta U = [\Delta u(k_i) \ \Delta u(k_i + 1) \dots \Delta u(k_i + N_c - 1)]$$

$$Y = Fx_a(k_i) + \Phi \Delta U$$

Aalto University
School of Science
and Technology

$$\Phi = \begin{bmatrix} C_{a}B_{a} & 0 & \cdots & 0 \\ C_{a}A_{a}B_{a} & C_{a}B_{a} & \cdots & 0 \\ C_{a}A_{a}^{2}B_{a} & C_{a}A_{a}B_{a} & \cdots & 0 \\ \vdots & \vdots & \cdots & \vdots \\ C_{a}A_{a}^{N_{p}-1}B_{a} & C_{a}A_{a}^{N_{p}-2}B_{a} & \cdots & C_{a}A_{a}^{N_{p}-N_{a}}B_{a} \end{bmatrix} \qquad F = \begin{bmatrix} C_{a}A_{a} \\ C_{a}A_{a}^{2} \\ \vdots \\ C_{a}A_{a}^{N_{p}} \end{bmatrix}$$

$$J = (R_s - Y)^T (R_s - Y) + \Delta U^T \bar{R} \Delta U \quad R_z^T = \begin{bmatrix} 1 & 1 & \cdots & 1 \end{bmatrix} r(k_i) = \bar{R}_z^T r(k_i)$$
$$J = \begin{bmatrix} R_z - Fx(k_i) \end{bmatrix}^T \begin{bmatrix} R_z - Fx(k_i) \end{bmatrix} - 2\Delta U^T \Phi^T (R_z - Fx(k_i)) + \Delta U^T (\Phi^T \Phi + \bar{R}) \Delta U$$

To find the minimum without constraints

$$\begin{split} &\frac{\partial J}{\partial \Delta U} = -2\Phi^T \left[ R_z - Fx(k_i) \right] + 2 \left[ \Phi^T \Phi + \overline{R} \right] \Delta U = 0 \\ \Rightarrow \Delta U = \left( \Phi^T \Phi + \overline{R} \right)^{-1} \Phi^T \left( R_z - Fx(k_i) \right) \end{split}$$

49

which can be written as

$$-(C_1 u(k_i - 1) + C_2 \Delta U) \le -U^{min}$$
  
$$(C_1 u(k_i - 1) + C_2 \Delta U) \le U^{max},$$

Similarly  $Y^{min} \leq Fx(k_i) + \Phi \Delta U \leq Y^{max}$ .

In short, minimize

$$J = (R_s - Fx(k_i))^T (R_s - Fx(k_i)) - 2\Delta U^T \Phi^T (R_s - Fx(k_i)) + \Delta U^T (\Phi^T \Phi + \bar{R}) \Delta U,$$

under the inequality constraints

# Constraints

Constraints must be related to the control variable  $\Delta U$ .

The inequalities  $\Delta U^{min} \leq \Delta U \leq \Delta U^{max}$  are equal to

$$\begin{array}{ll} -\Delta U \leq -\Delta U^{min} & & \\ \Delta U \leq \Delta U^{max} & & \text{or} & & \begin{bmatrix} -I \\ I \end{bmatrix} \!\! \Delta U \leq \!\! \begin{bmatrix} -\Delta U^{min} \\ \Delta U^{max} \end{bmatrix} \!\!$$

Note that 
$$\begin{bmatrix} u(k_i) \\ u(k_i+1) \\ u(k_i+2) \\ \vdots \\ u(k_i+N_c-1) \end{bmatrix} = \begin{bmatrix} I \\ I \\ I \\ \vdots \\ I \end{bmatrix} u(k_i-1) + \begin{bmatrix} I & 0 & 0 & \dots & 0 \\ I & I & 0 & \dots & 0 \\ I & I & 0 & \dots & 0 \\ \vdots & I & I & I & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ I & I & \dots & I & I \end{bmatrix} \begin{bmatrix} \Delta u(k_i) \\ \Delta u(k_i+1) \\ \Delta u(k_i+2) \\ \vdots \\ \Delta u(k_i+N_c-1) \end{bmatrix}.$$

and Technology

50

$$\begin{bmatrix} M_1 \\ M_2 \\ M_3 \end{bmatrix} \Delta U \leq \begin{bmatrix} N_1 \\ N_2 \\ N_3 \end{bmatrix},$$

where the data matrices are

$$\begin{split} M_1 &= \begin{bmatrix} -C_2 \\ C_2 \end{bmatrix}; \ N_1 = \begin{bmatrix} -U^{min} + C_1 u(k_i - 1) \\ U^{max} - C_1 u(k_i - 1) \end{bmatrix}; \ M_2 = \begin{bmatrix} -I \\ I \end{bmatrix}; \\ N_2 &= \begin{bmatrix} -\Delta U^{min} \\ \Delta U^{max} \end{bmatrix}; \ M_3 = \begin{bmatrix} -\Phi \\ \Phi \end{bmatrix}; N_3 = \begin{bmatrix} -Y^{min} + Fx(k_i) \\ Y^{max} - Fx(k_i) \end{bmatrix}. \end{split}$$

or  $M\Delta U \leq \gamma$ ,

Matlab's command *quadprog* can for example be used.

# Final steps

- Today's lecture no 12 (1.12) is the last lecture. The 11th exercise was the last exercise. The last homework no 6 has been published.
- Second Intermediate exam (IE2) on Thursday 8.12, 14:00-16:00, room T3 (T-house).
- First full exam (Kurssitentti) on Tuesday 13.12, 13:00-16:00, hall AS1.
- No registrations are needed for these exams. You can participate in both if you wish. Intermediate exams cannot be repeated. For the full exams later (next: January 2023) you have to register.
- For the grading of the course, see lecture slides, Chapter 1. (If you participate in both intermediate and full exam, then the better of (IE1+IE2), (Full exam), counts.)

53

# The end

Good luck for the future!

### Contents

- Classical control theory: SISO-systems, linear or linearized system models
- Extension to multivariable (MIMO) systems
- · Performance and limitations of control
- · Uncertainty and robustness,
- IMC-control,
- · LQ and LQG control
- · Optimal control
- · Introduction to Model Predictive Control
