ELEC 8201 Control & Automation

Design of Automation Applications

Valeriy Vyatkin, Pranay Jhunjhunwala

Aalto University

2022

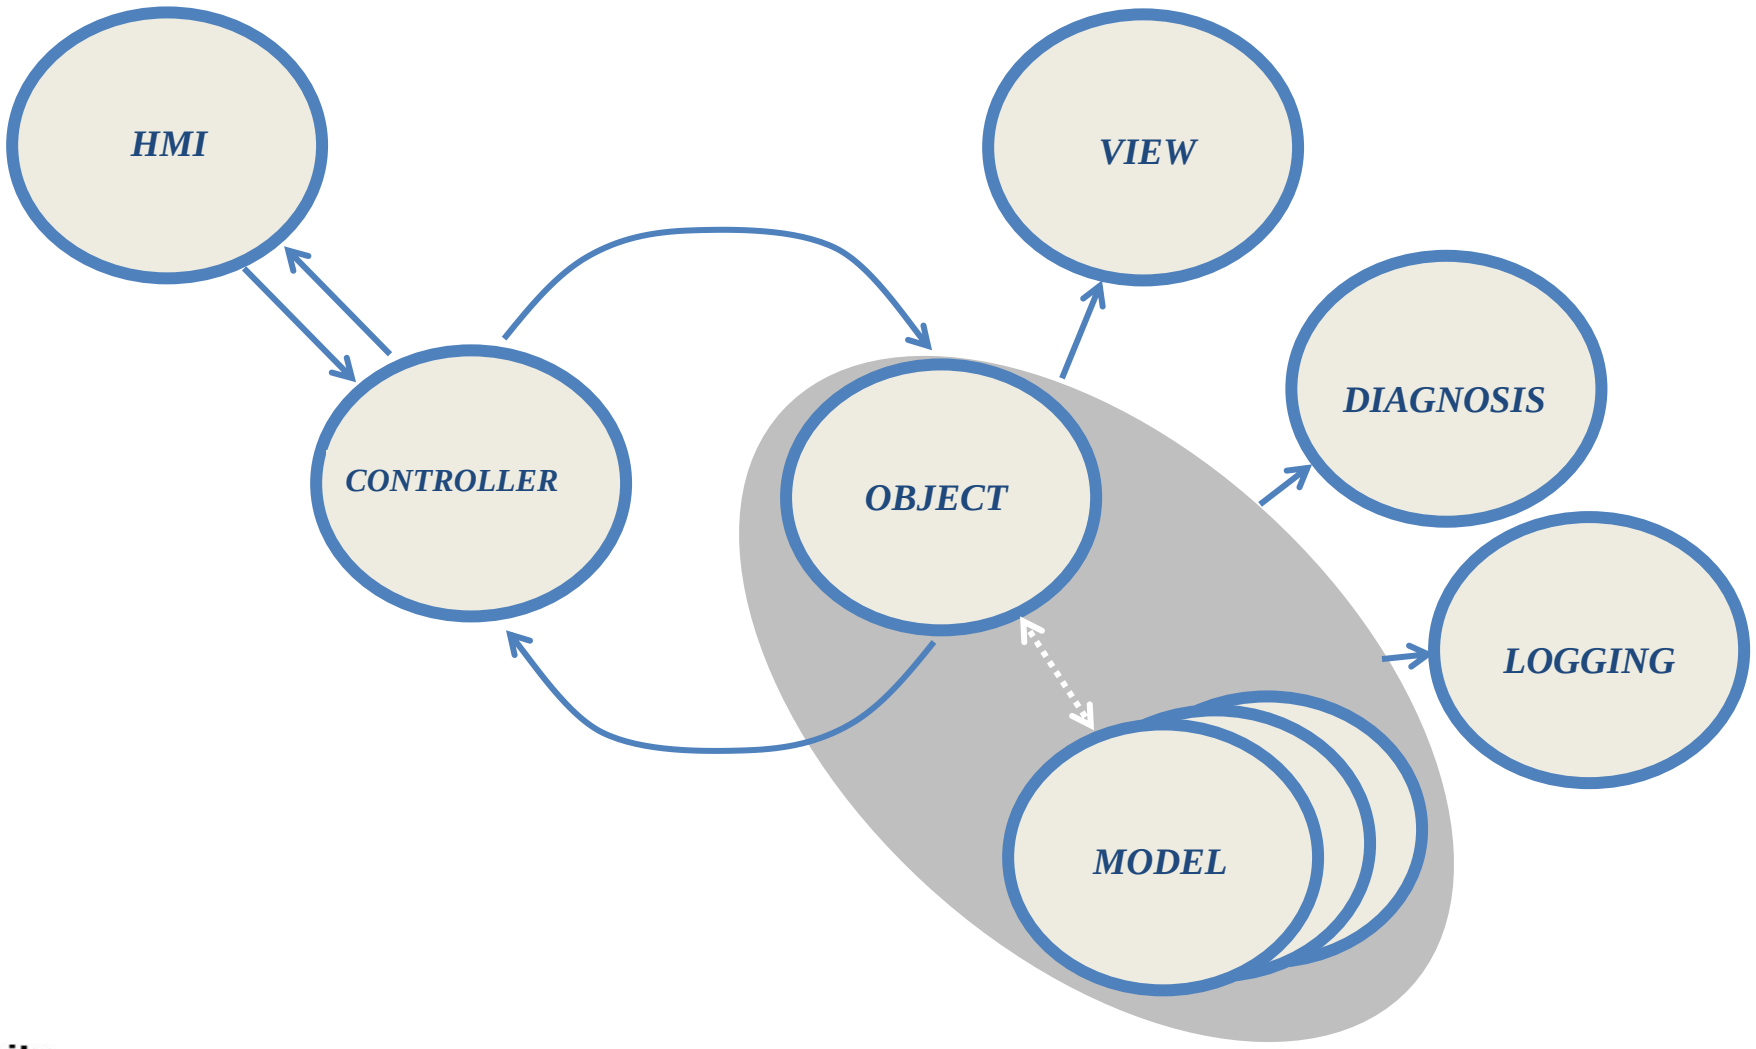
Plan

1. Develop complex applications with function blocks
2. How to implement continuous control in function blocks?
3. Object-based design
4. Service-oriented design

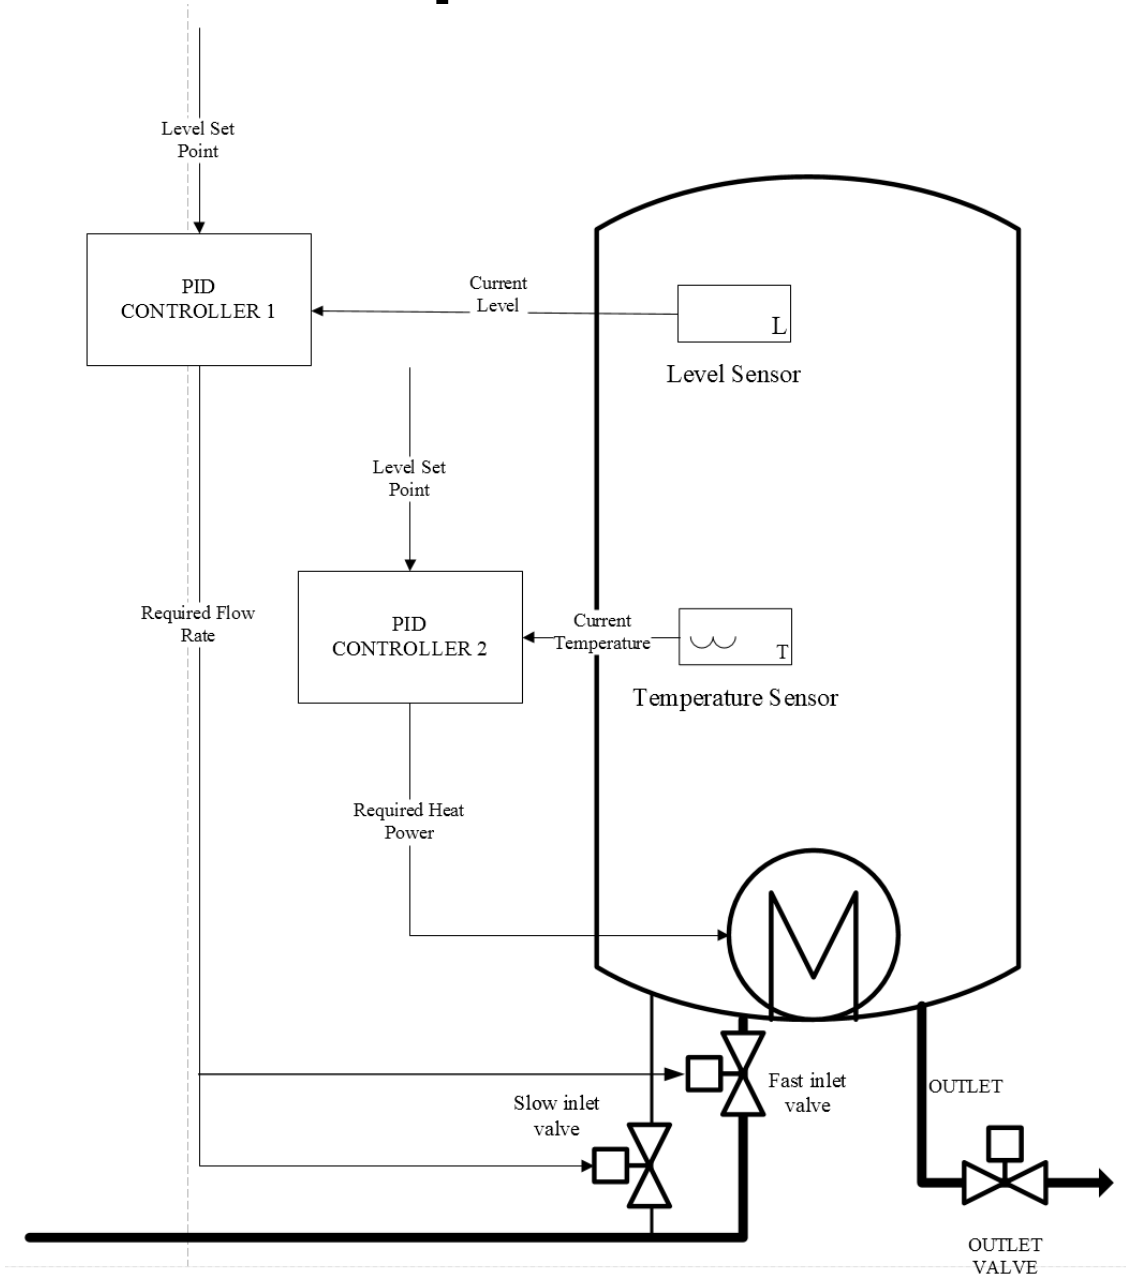
Start with interfaces

- Plant inputs and outputs
- Human-machine interfaces
  - Buttons and switches
  - Display process variables and trends
  - …

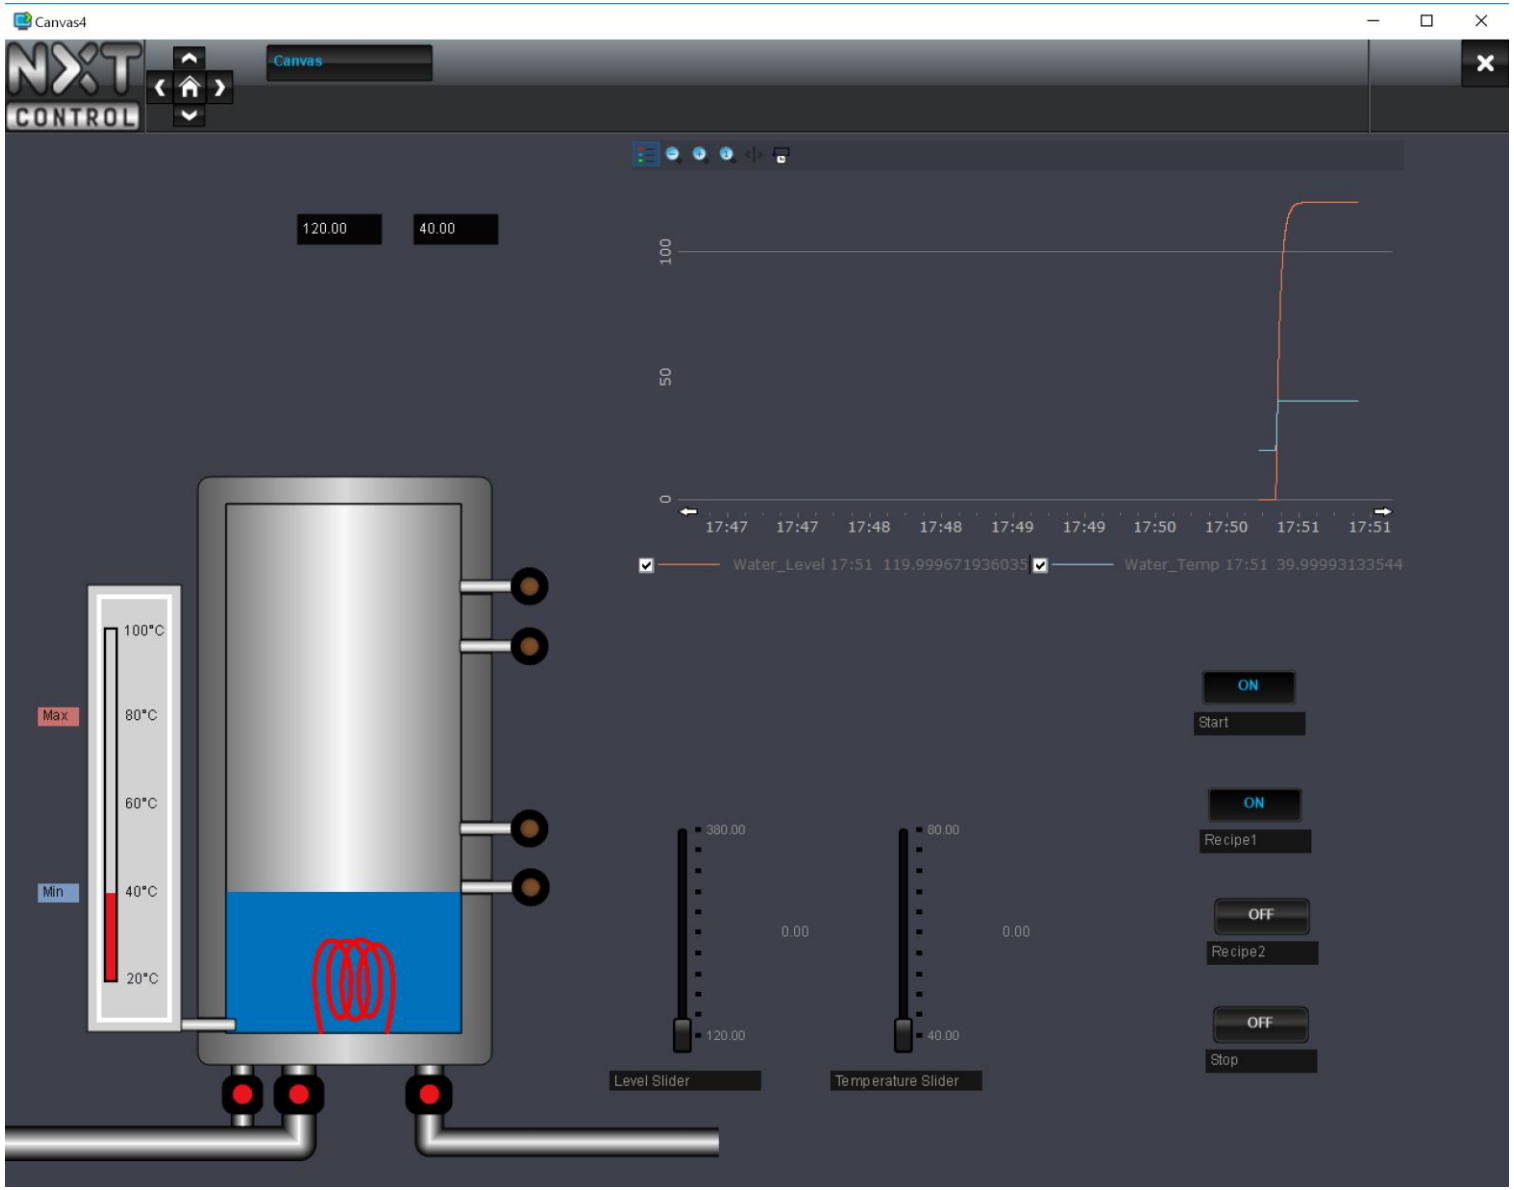
Model-View-Control design pattern



Example: Tank



Simulated tank and HMI



Requiremets?

- Maintain water level
- Maintain certain temperature
- Maintain temperature while increasing water level
- …
- More general:
  - Apply a recipe to a batch of product
  - While ensuring bumpless change of water level and temperature

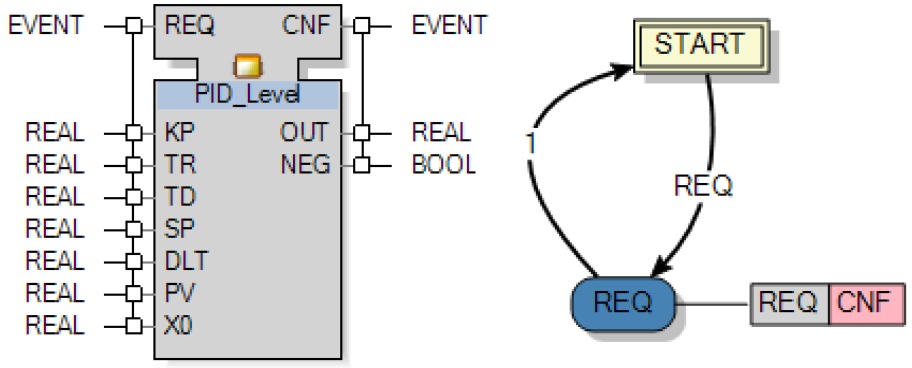
Continuous control of level and temperature



```
ALGORITHM REQ IN ST:
(* Add your comment (as per IEC 61131-3) here
PID with Bumpless Transfer and Anti-Reset Windup, REAL PV+XOUT
*)
ERROR:=PV-SP;

IF FIRSTTIME THEN
   ITERM:=(ERROR-X0)/KP;
   DTERM:=0;
ELSE
   ITERM:=ITERM+ERROR*DLT/TR;
   DTERM:=(3*(PV-X3)+X1-X2)*TD/DLT/10;
END_IF;
OUT:=-KP*ERROR-ITERM-DTERM;
X3:=X2;X2:=X1;X1:=PV;
ITERM:=ITERM-ERROR*DLT/TR;
NEG:=0;
IF OUT<0 THEN
   NEG := 1;
   // OUT:=0;
ELSIF OUT>100 THEN
   OUT:=100;
END_IF;
FIRSTTIME:=FALSE;
END_ALGORITHM
```

KP: Proportional constant

TR: Integral constant
TD: Derivative constant

SP: Setpoint. The target for your process variable
DLT: Cycle time constant
PV: Process Variable, the value you want to control
X0: Default initial value.
OUT: PID output

NEG: Flag indicating that OUT<0

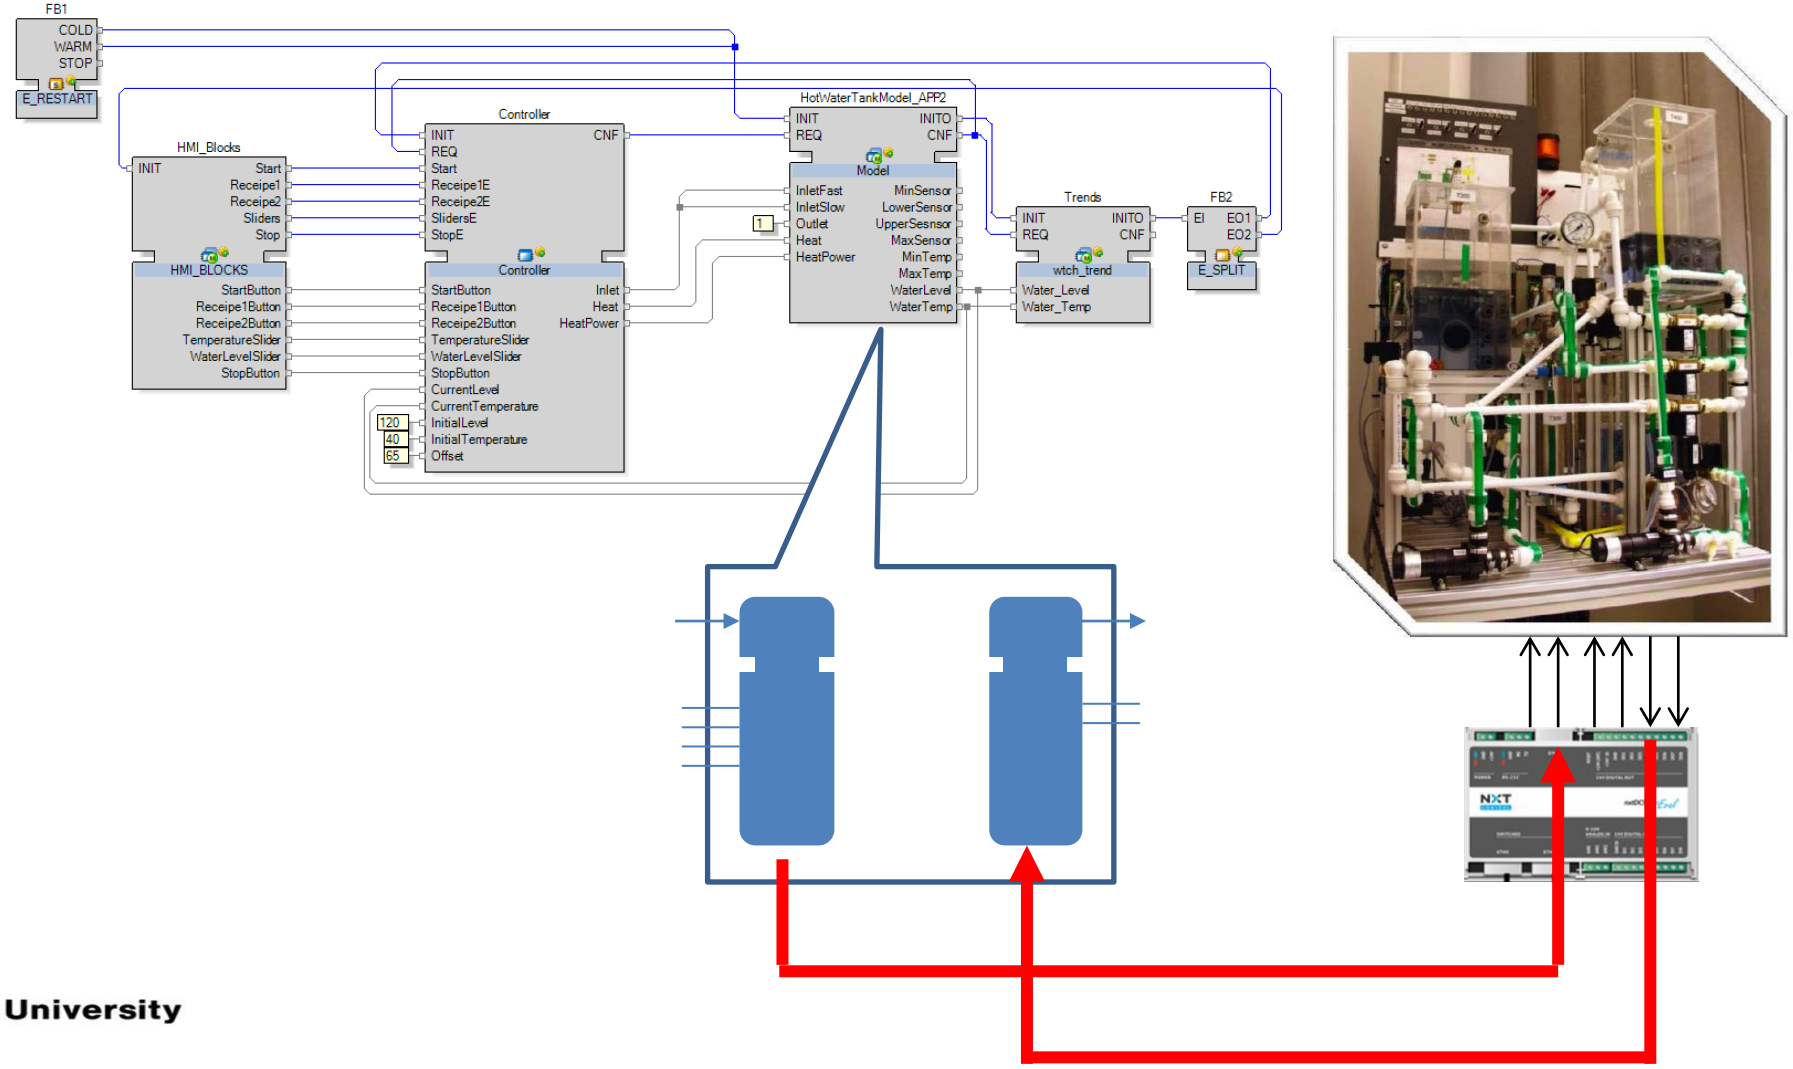
$$X_{OUT} = -(K_p \cdot e + \int \frac{e}{T_R} dt + T_d \frac{de}{dt})$$

e=PV-SP;

- The manipulated variable XOUT, the process variable PV and the proportionality constant KP are of type REAL, as are the internal terms ERROR, ITERM and ETERM.
- The inputs PV, SP and X0 are assumed to be limited to the range 0 to 100 per cent of full scale, and the output XOUT is limited to the same range.

How to deploy this code to control a real Tank?

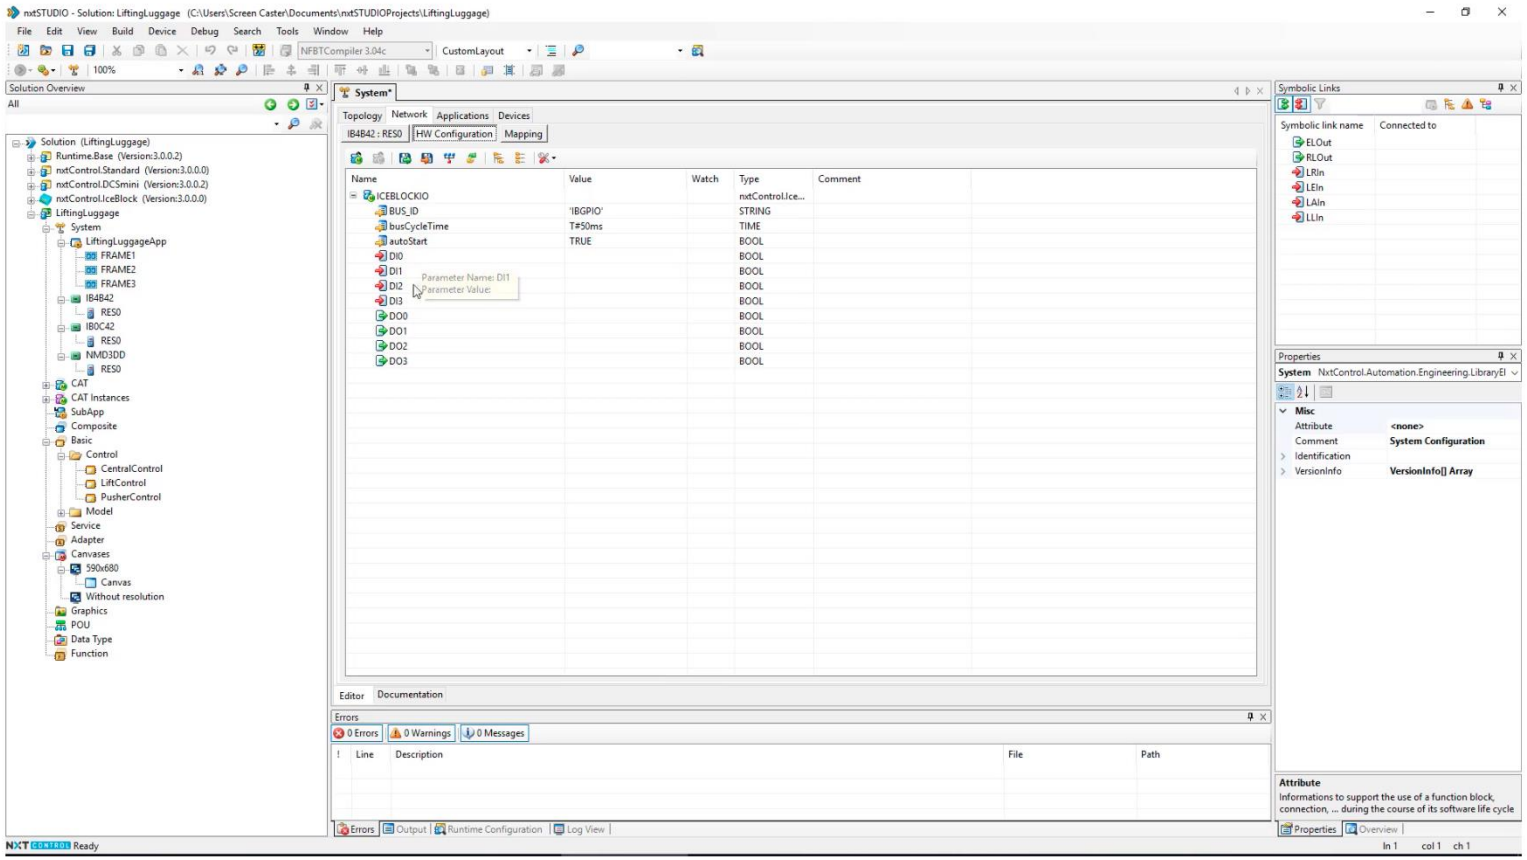
Substitute the plant model with interface to PLC I/O



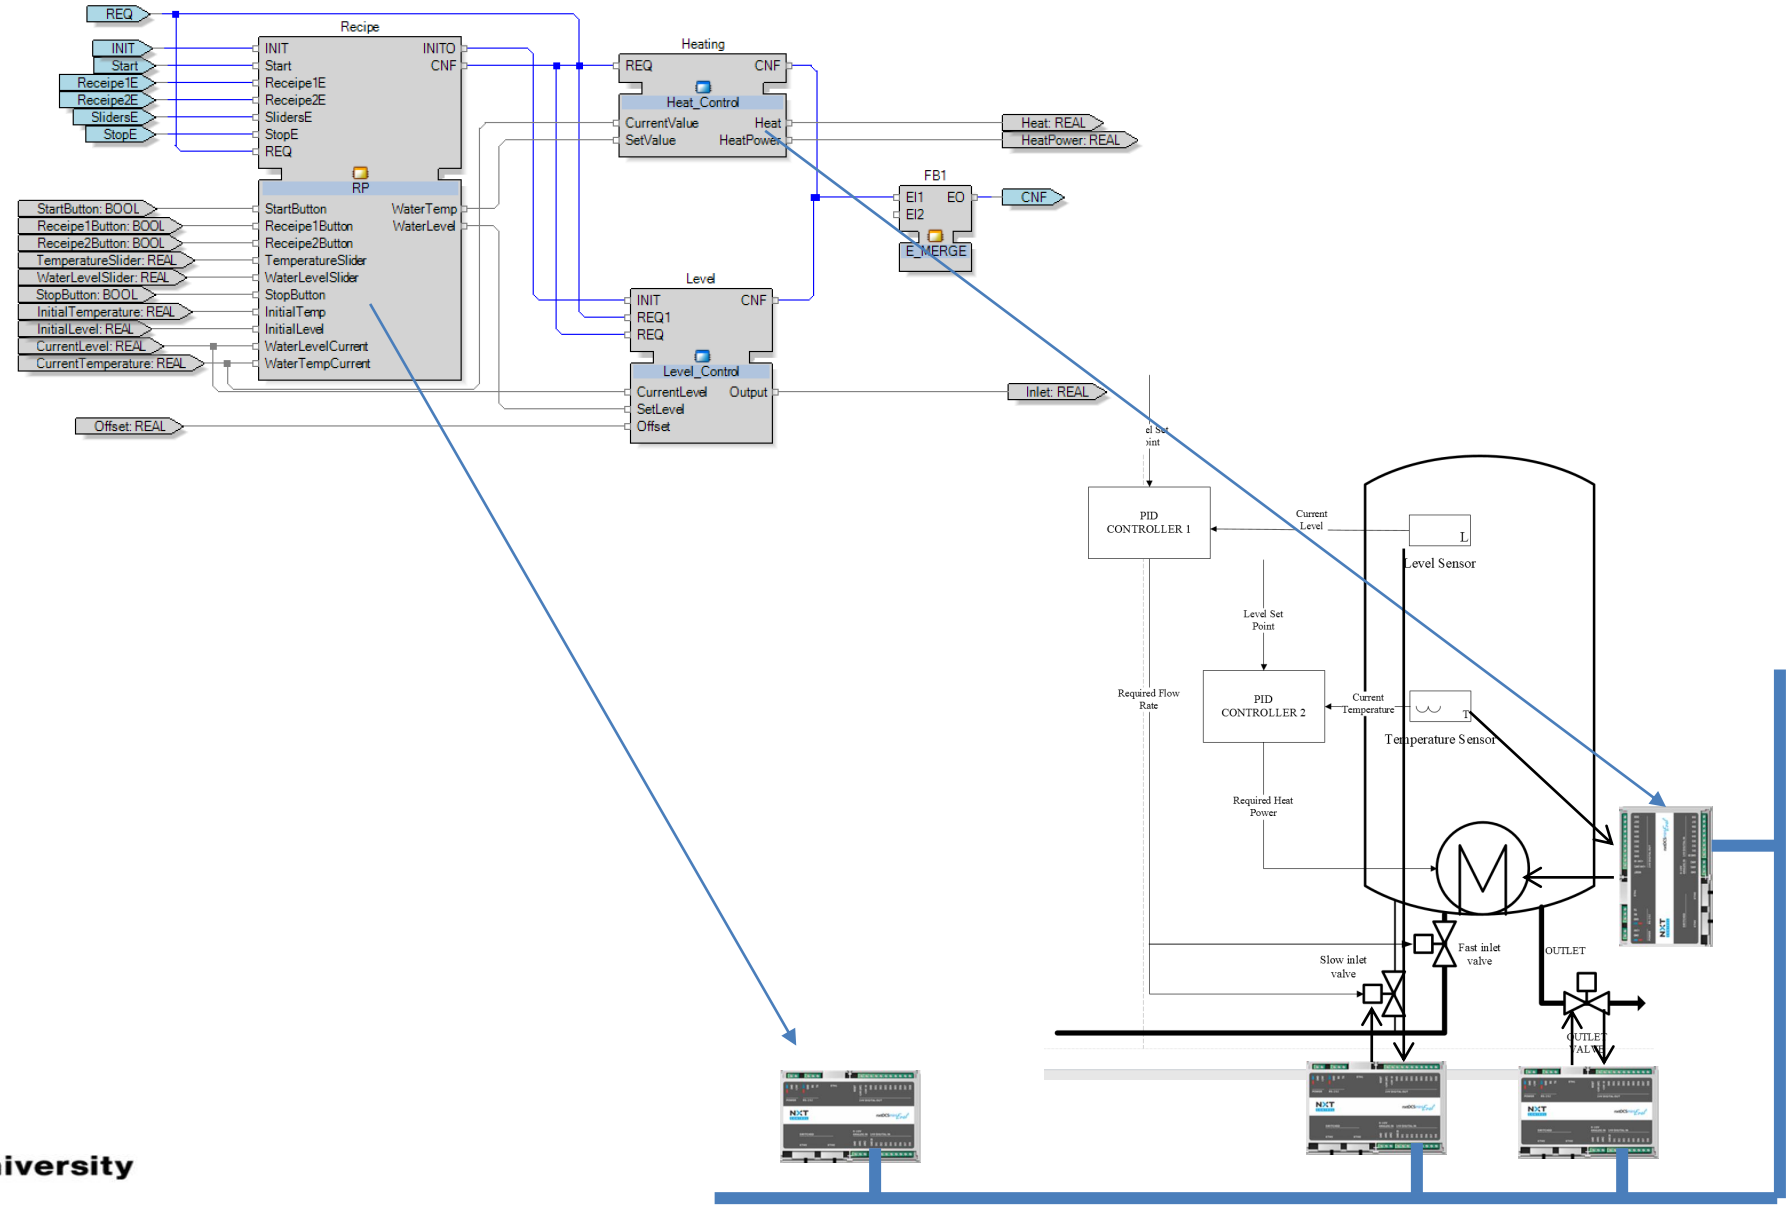
How to connect application with PLC I/Os?

Watch the lesson:

Adding Symbolic links to controller IO's and IceBlock HW configuration



Distributed Control System



Aalto University

Object-based modular design: EnAS lab demo

Assembly system consists of

six conveyors

pallet

two identical jack stations

Two sledges

two grippers

ten sensors.

Controlled using seven PLCs

What to remember?

- How to control continuous process with PLC?
- Batch process: combination of discrete steps (recipe) and continuous processes.
- Object-oriented architecture
  - Benefits: re-use of code, flexibility
- Service-oriented architecture
  - Benefits: re-use of services, flexibility of loose coupling, relience on Cloud and Fog services
