

# PRODUCT ARCHITECTURE

26.09.2023

# Learning Objectives

- Understand the fundamentals of product architecture
- Learn to establish a product architecture
- Learn to evaluate the product's architectural differences, features and limitations

# What's Product Architecture?

---

Product architecture mainly deals with how a product is arranged into physical parts, components and assemblies.

It can be defined as:

1. The arrangement of functional elements.
2. The mapping of functional elements to physical components.
3. The specification of the interfaces between interacting physical components.

# Types of Product Architectures

Modular

Integrated

Mixed

# Modular Product Architecture

One Function → One Component

# Integrated Product Architecture

- One Function → Multiple Components
- Multiple Functions → One Component

# Modular Vs. Integrated Which architecture is better..?

- Performance
- Serviceability
- Sustainability
- Cost to develop
- Cost to manufacture
- Maintenance

Mixed Product Architecture

# Steps to Define Product Architecture

1. Identify and list all possible functions essential to build a product
2. Understand the relationship between those functions
3. Create a functional model/ diagram showing those relations
4. Create Clusters
5. Draw approximate product layouts or geometries
6. Identify mandatory or unintentional interactions between those functions

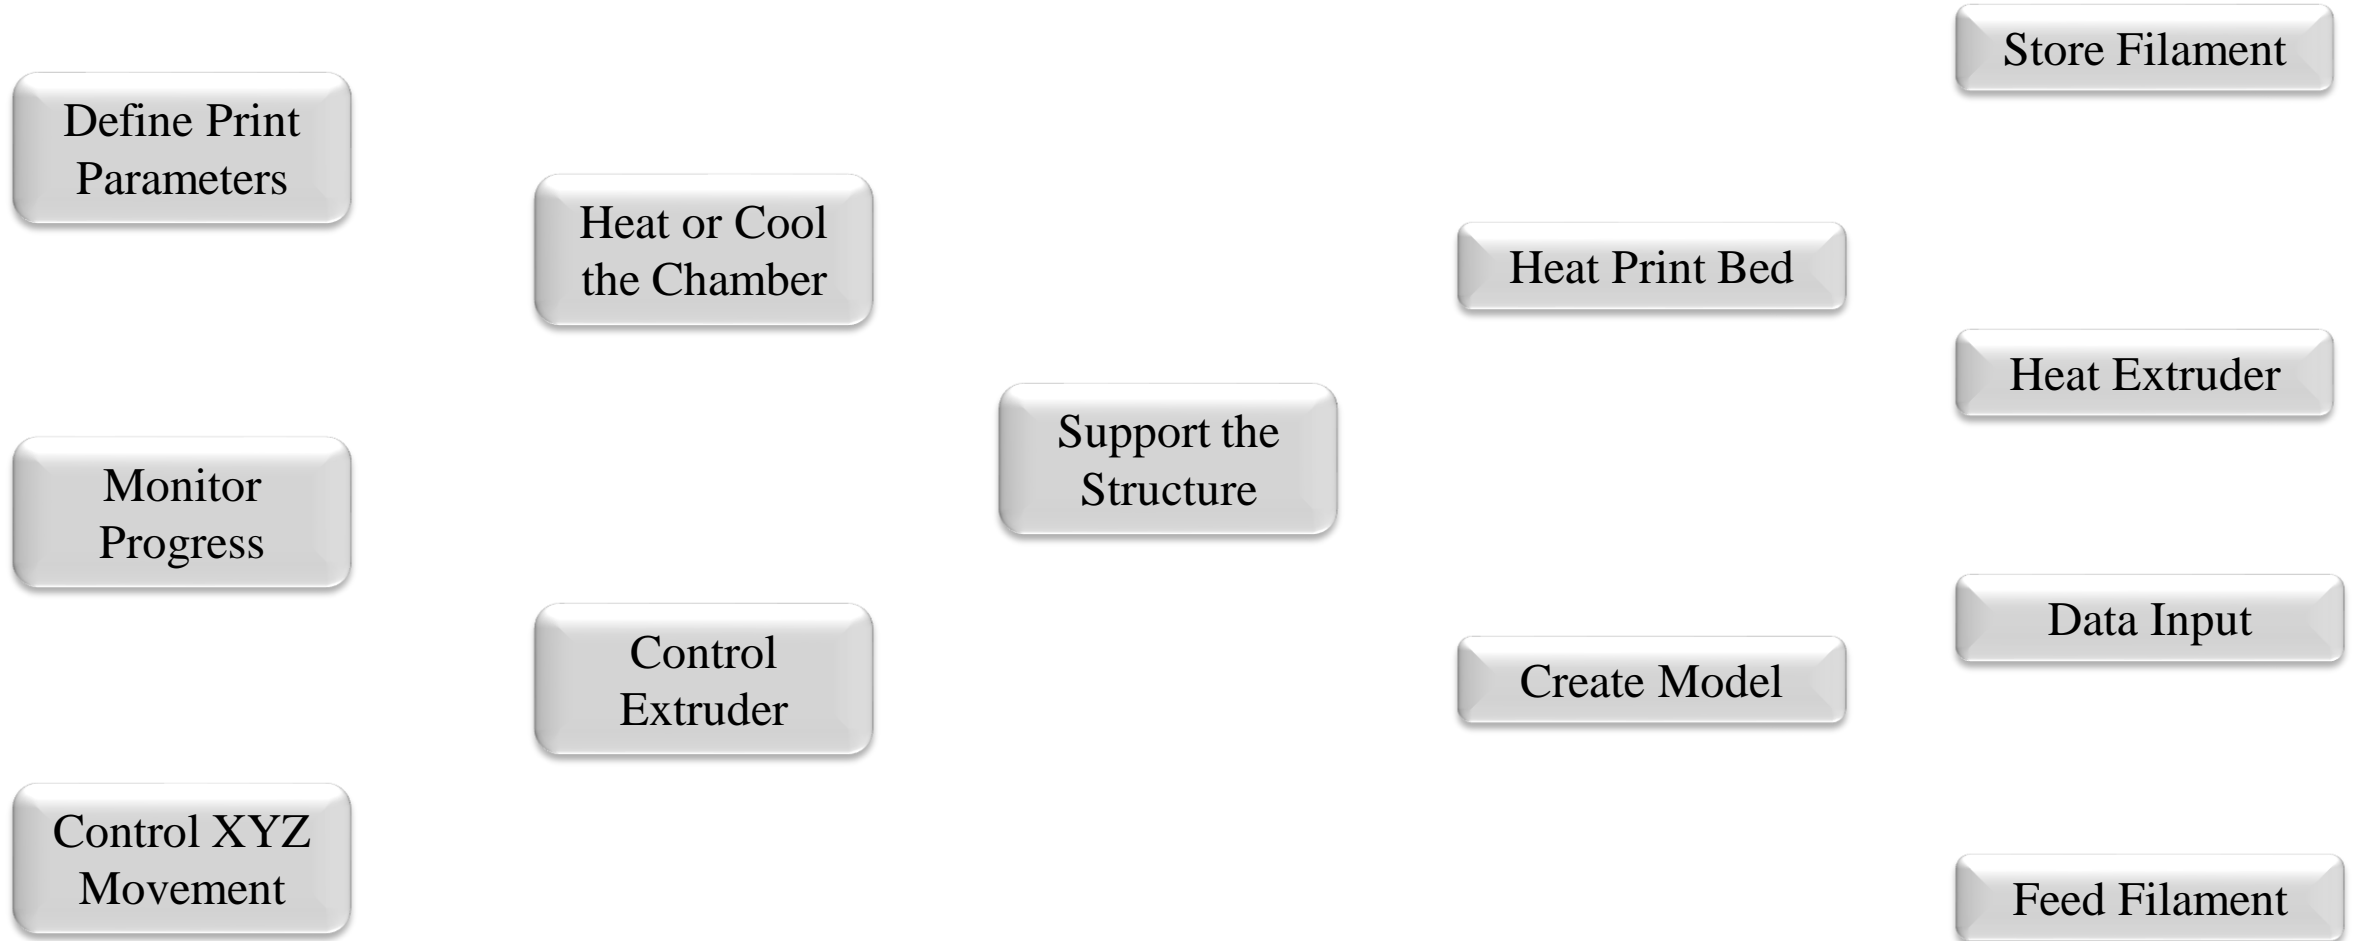

Practical Example

# 3D Printers

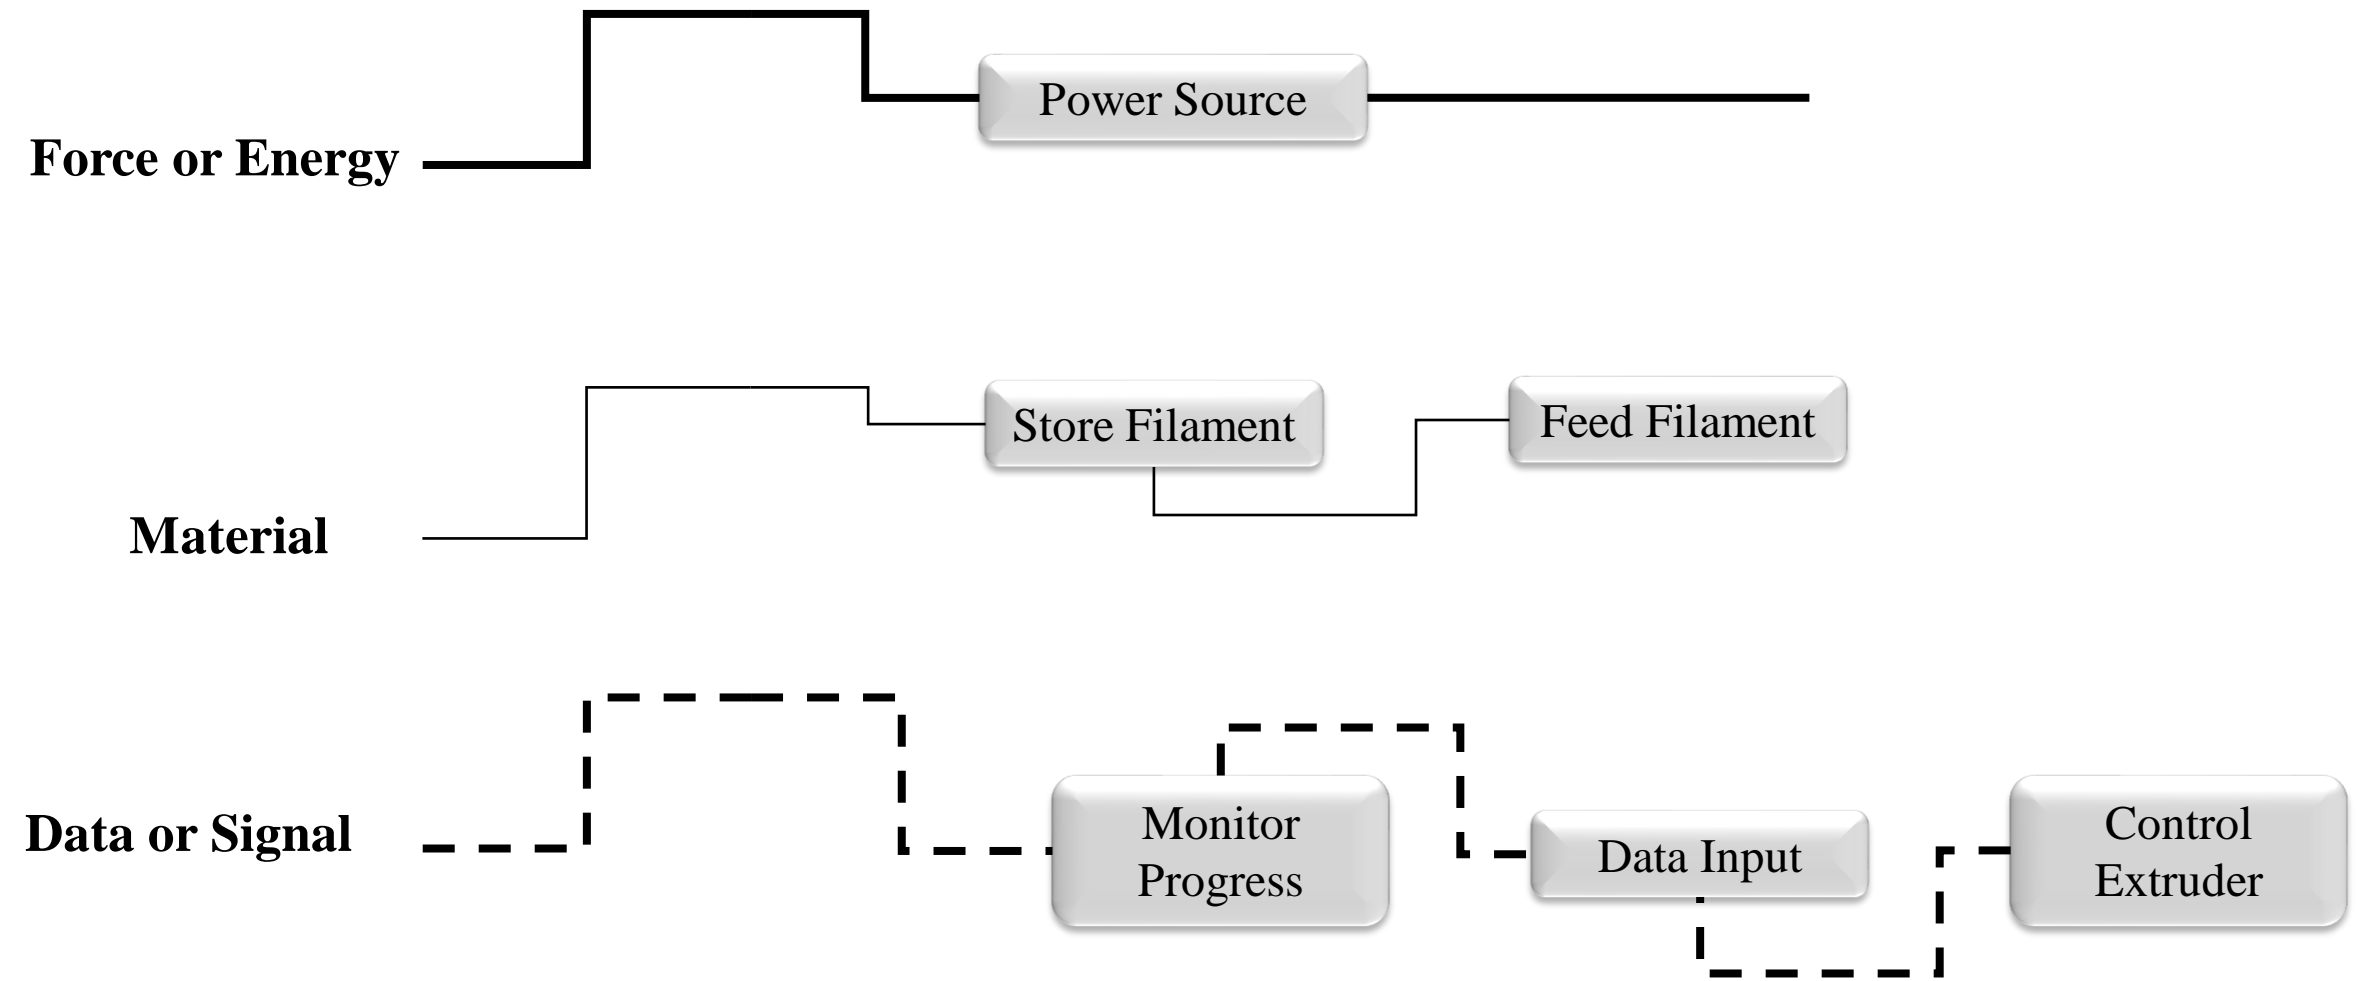

---

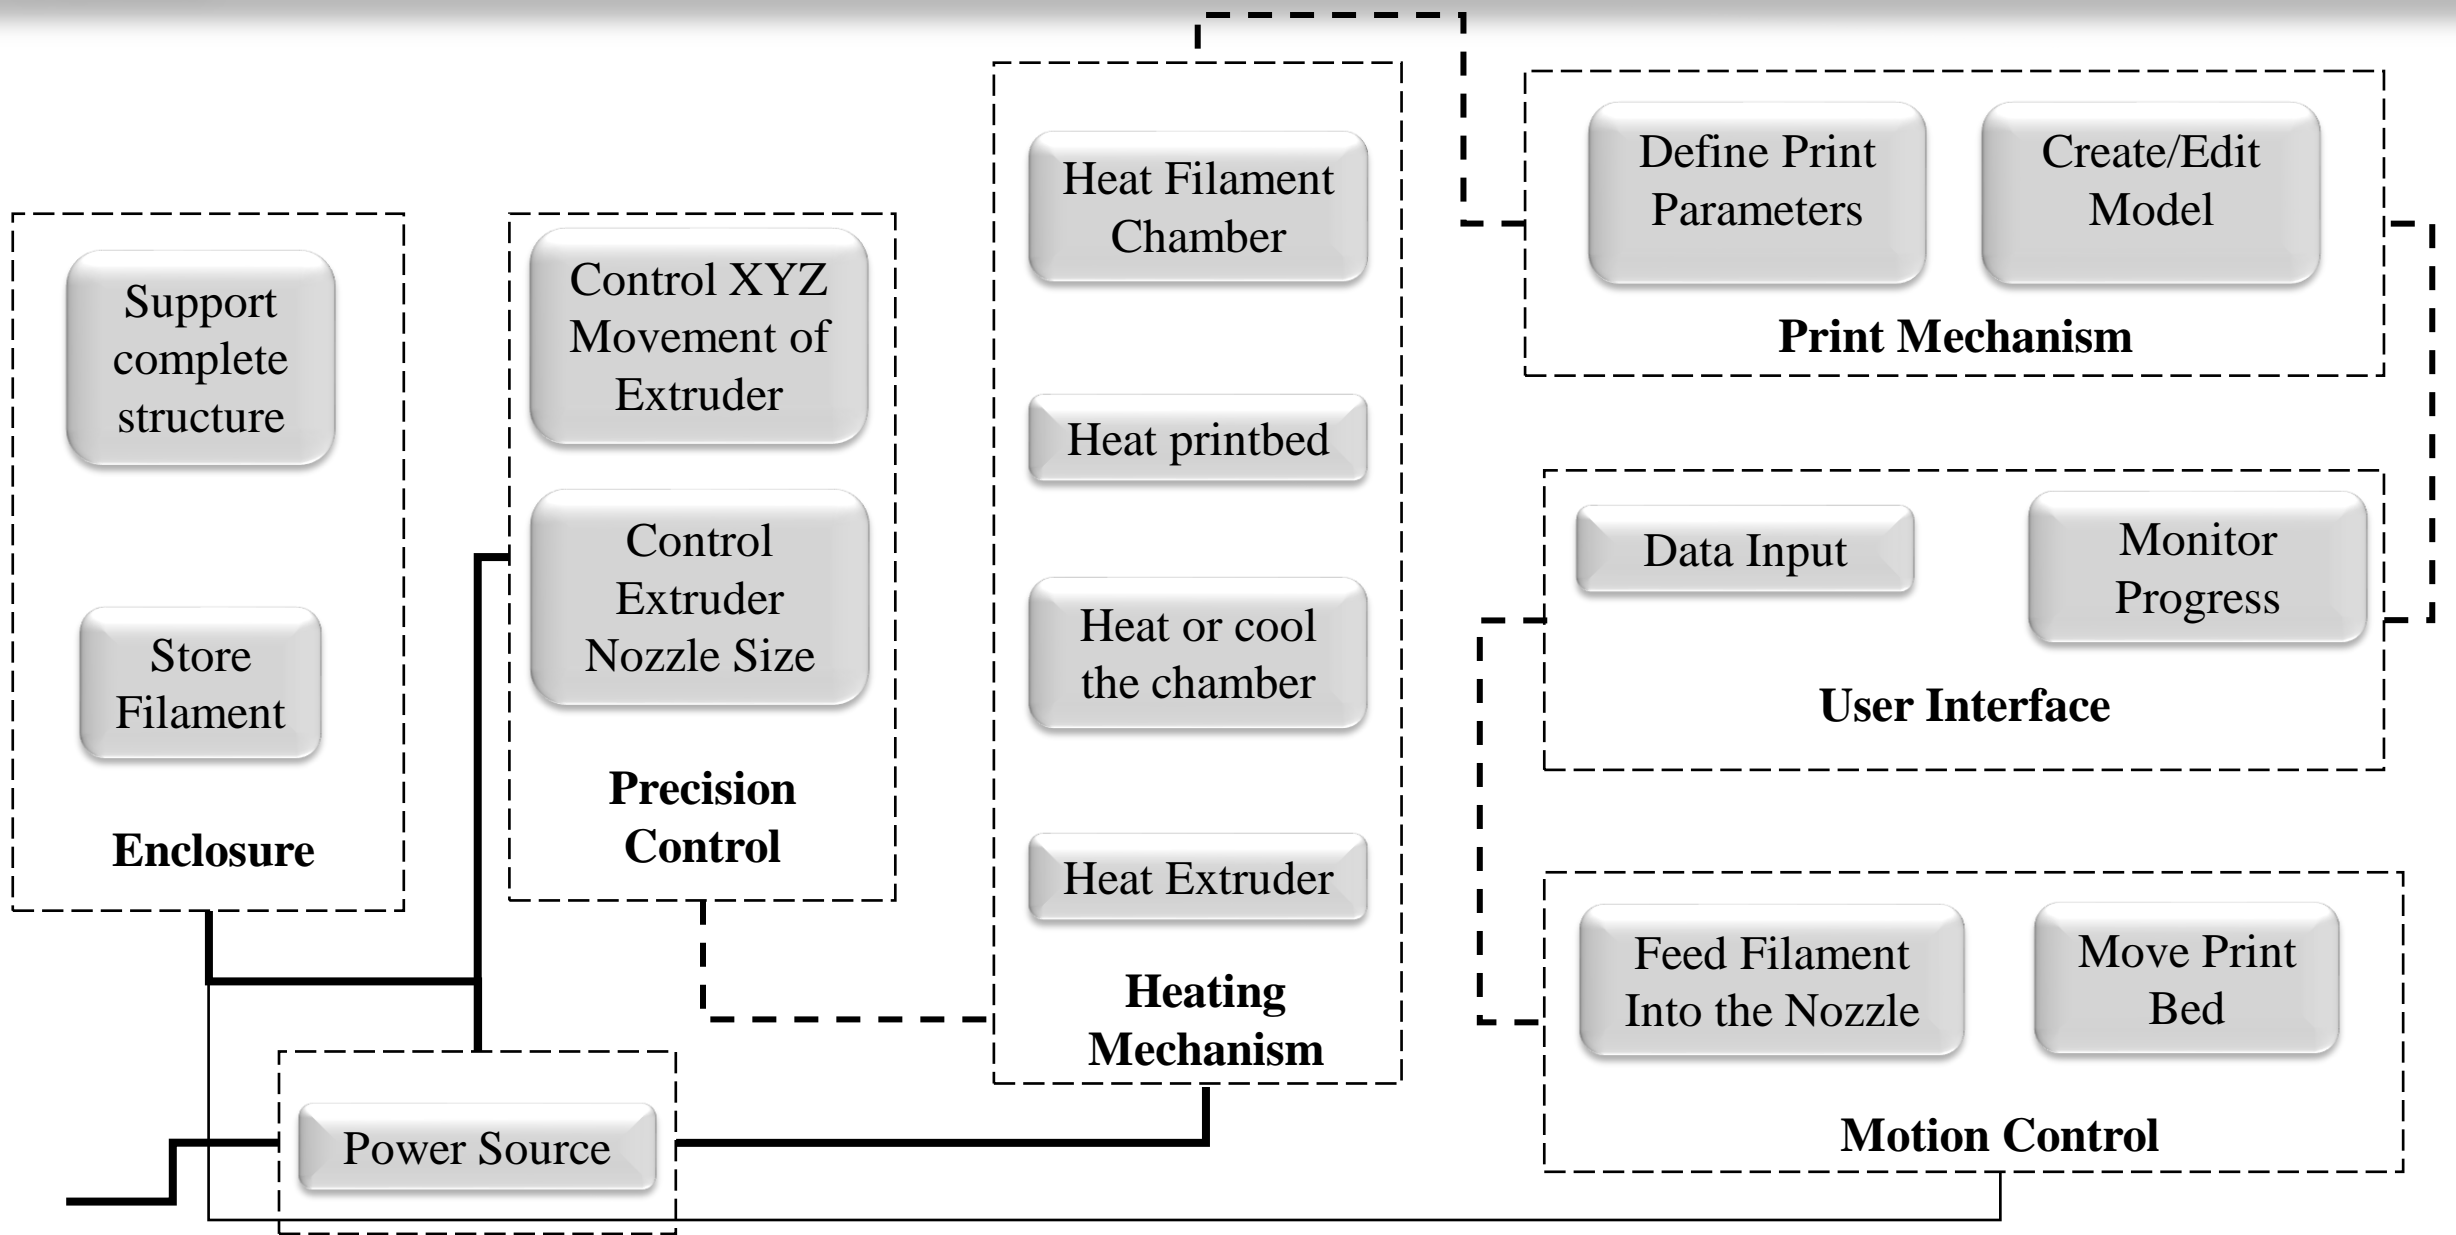

# Functions Essential to Build a 3D Printer

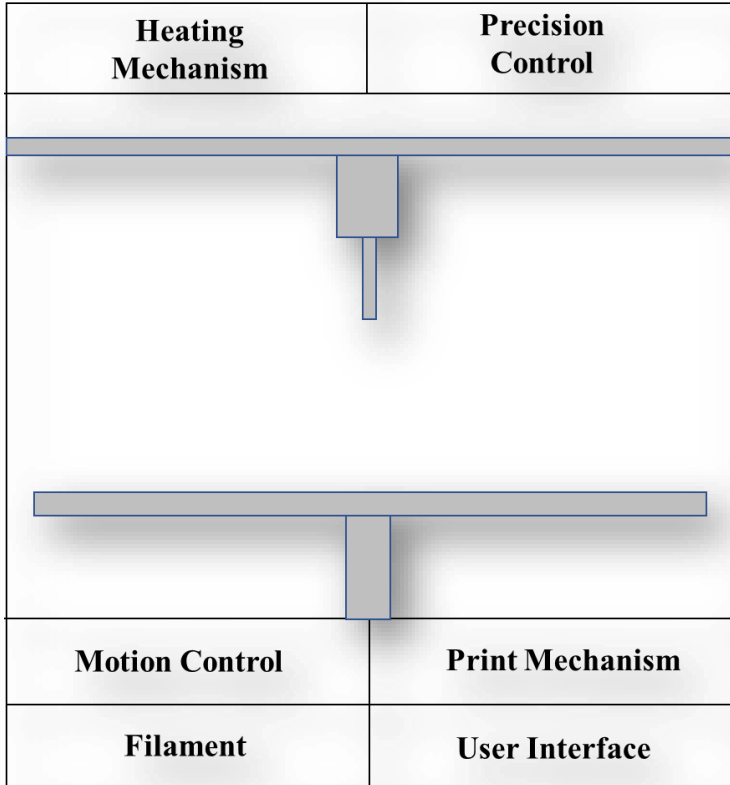

# Relation Between Functions

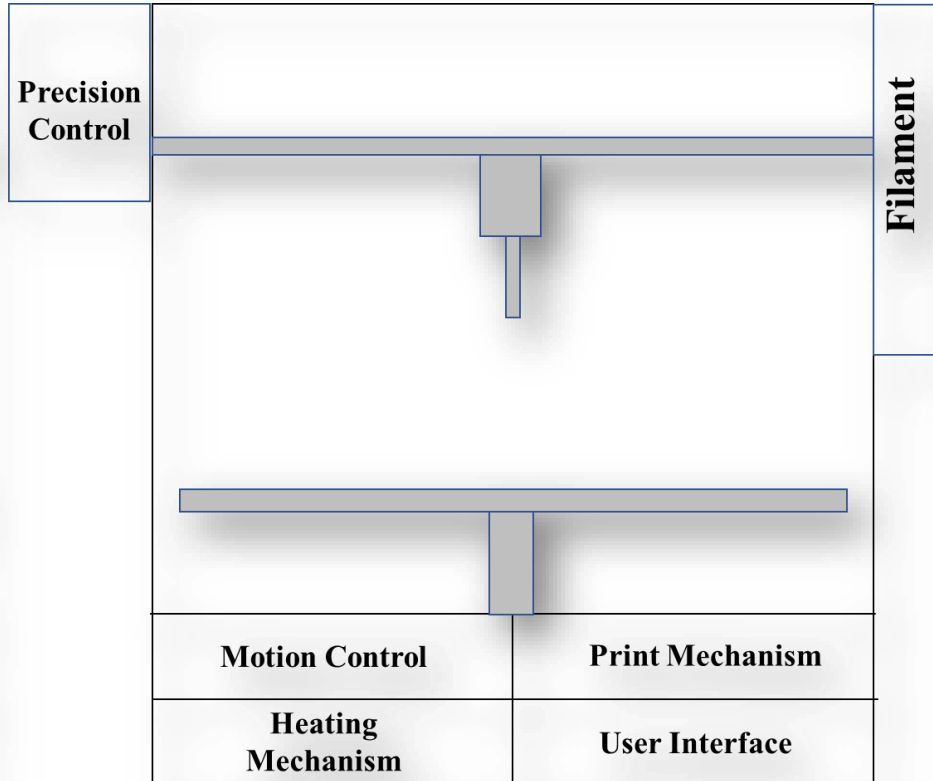

# Chunks

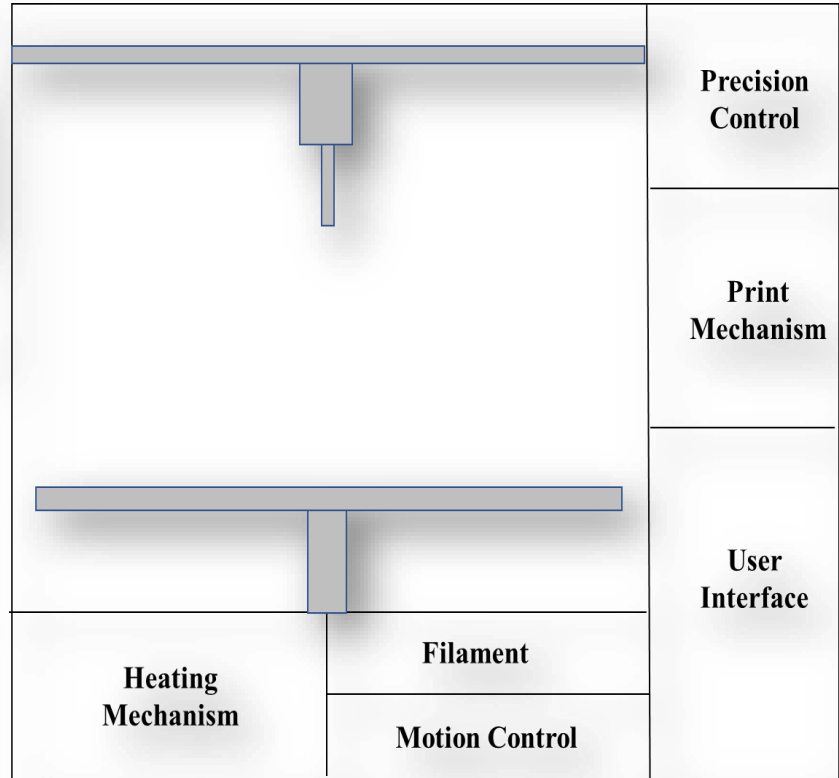

## Architecture Layout 1

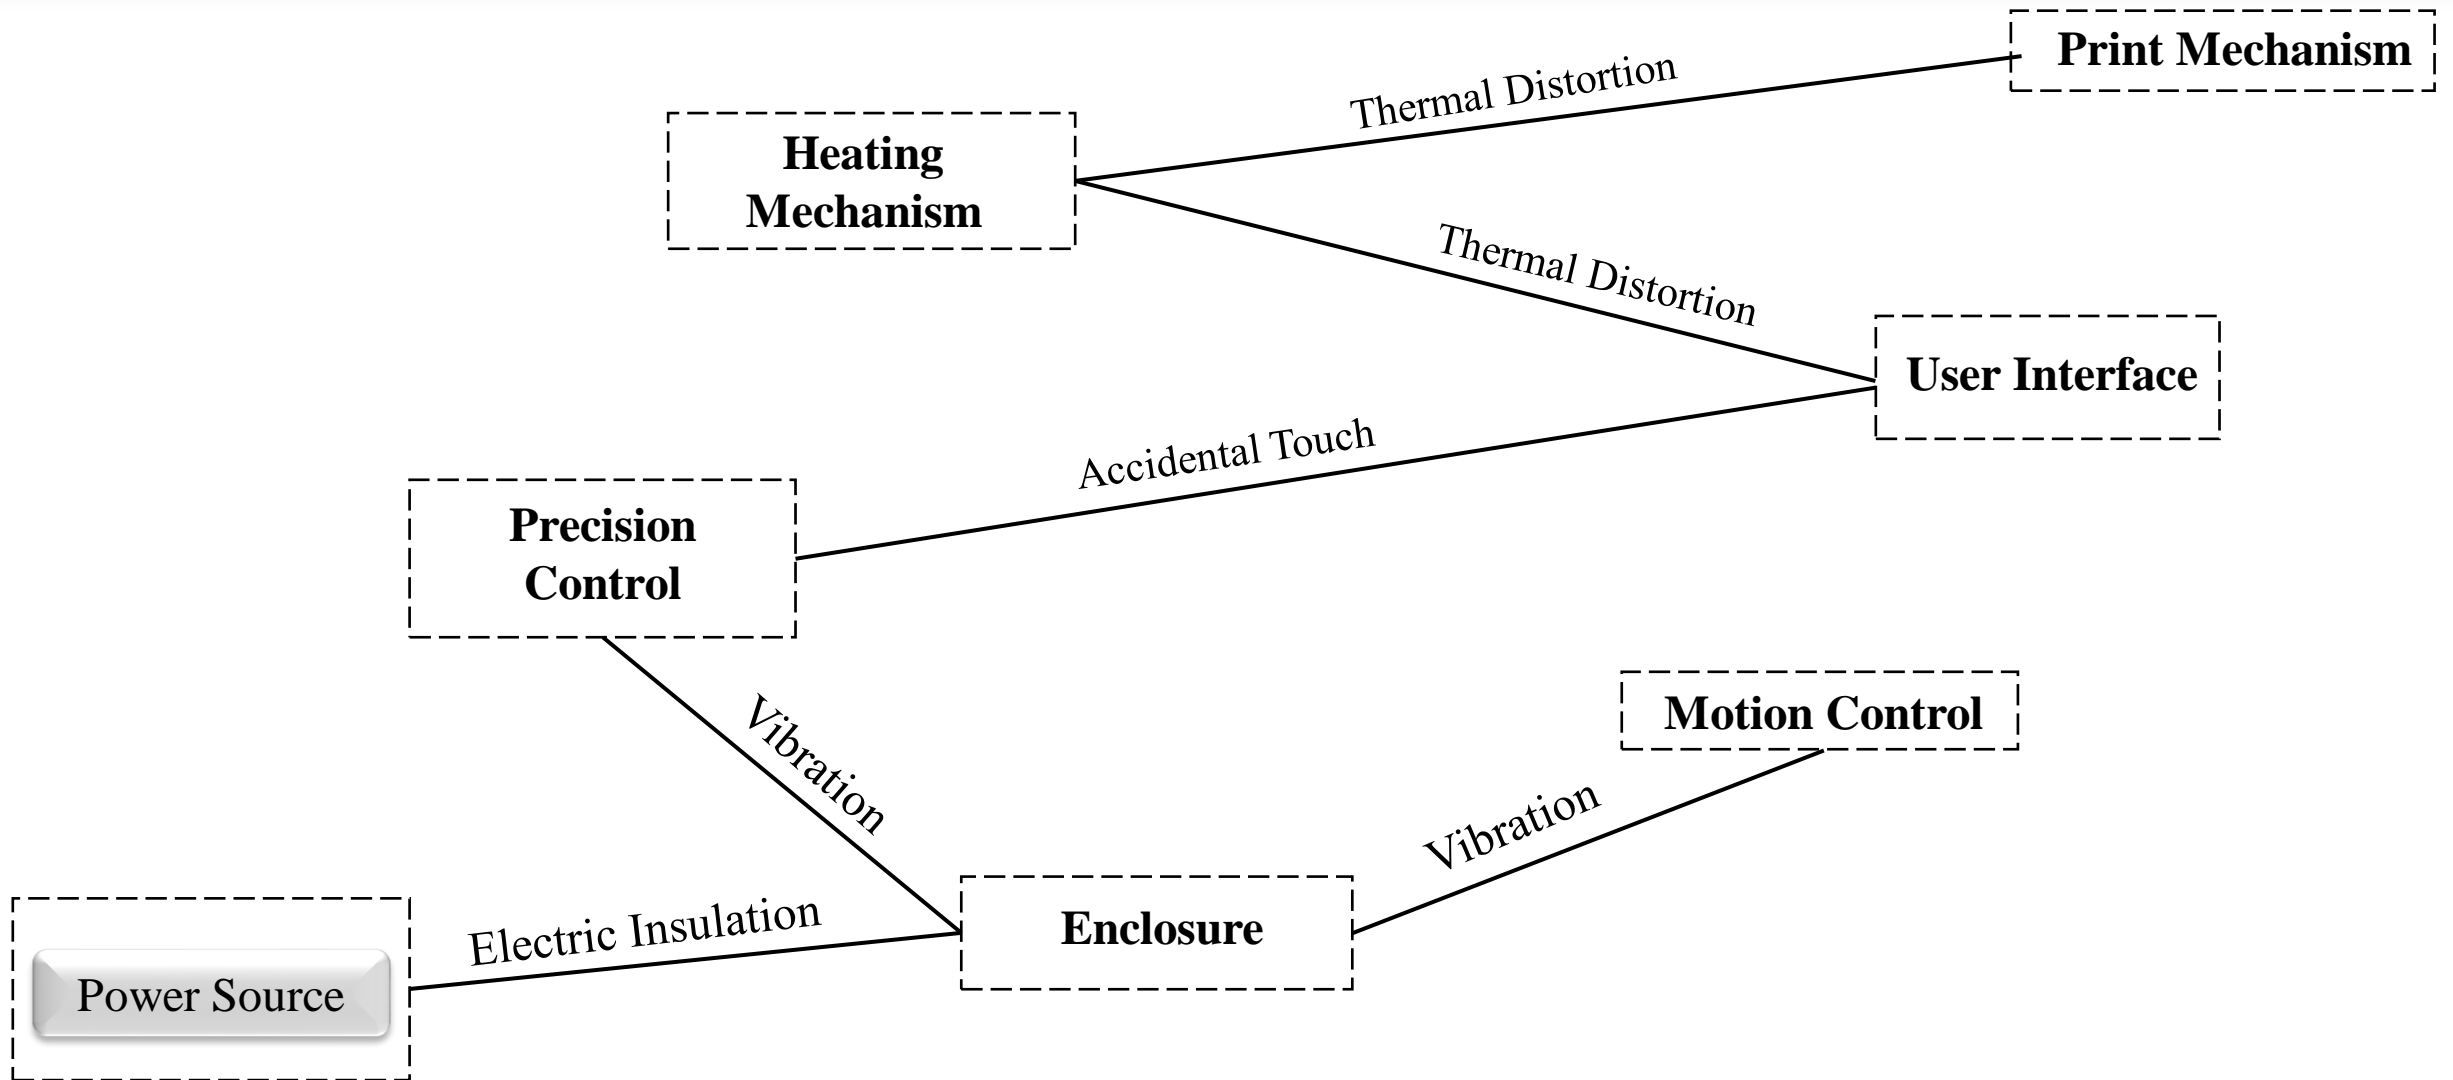

## Architecture Layout 2

## Architecture Layout 3

# Interaction Graph

# Pro Tips

Generally, we can group technical decisions into three categories

- ***Technical decisions that are easy to change:*** Type of material used, minor versions of software libraries, etc.
- ***Low-risk technical decisions which we probably don't need to change:***  
Using Linux, IOS or Android-based systems etc.
- ***High-risk technical decisions:*** Buying storage for a local data center, deciding on a software language, a wireless protocol or a framework/platform, etc

# Summary

---

- Architecture choices define the sub-systems and modules of the product platform or family.
- Architecture determines:
  - Ease of production variety
  - Feasibility of customer modification
  - System-level production costs
- Key Concepts:
  - Modular vs. Integral architecture
  - Clustering into chunks
  - Planning product families

**Thank You!**
