

POWER

CS-E407519 Lecture 2

Photo by American Public Power Association on Unsplash

OUTLINE

- Emissions and climate action potential of power sector
- Role of NO₂ in detecting CO₂ emissions
- Automated detection of atmospheric NO₂ plumes from satellite data (paper)
- Convolution Neural Networks (CNN)

POWER

GLOBAL CO2 EMISSIONS BY SECTOR

CARBON FOOTPRINT OF ENERGY TRANSMISSION

Energy industries total GHG emissions were 13,06 mln tCO₂-eq in 2020

Source: Statistics Finland

Greenhouse gas emissions of Fingrid in 2020 Source: Fingrid

MAIN STRATEGIES

- De-carbonize power generation
 - Direct limits on emissions: EU Large Combustion Plant Directive (LCPD, 2001/80/EC)
 - Nuclear energy
 - Green energy
- Smart grids
- Grid-scale storage
- Electrification
- Policies affecting demand: EU Emissions Trading Scheme (from 2005)

NITROGEN DIOXIDE (NO₂)

NITROGEN DIOXIDE (NO₂) POLLUTION

- NO₂ and NO_x are highly reactive pollutants
- Harmful to humans (respiratory system) and the environment (acid rains, air quality, water nutrient pollution)
- Primarily produced during combustion (transport, coal- and gas power, forest fires)
- Short-lived in the atmosphere (few hours), converts to other pollutants through photochemical reactions

“

NO₂ is widely assumed to be a robust proxy for combustion CO₂

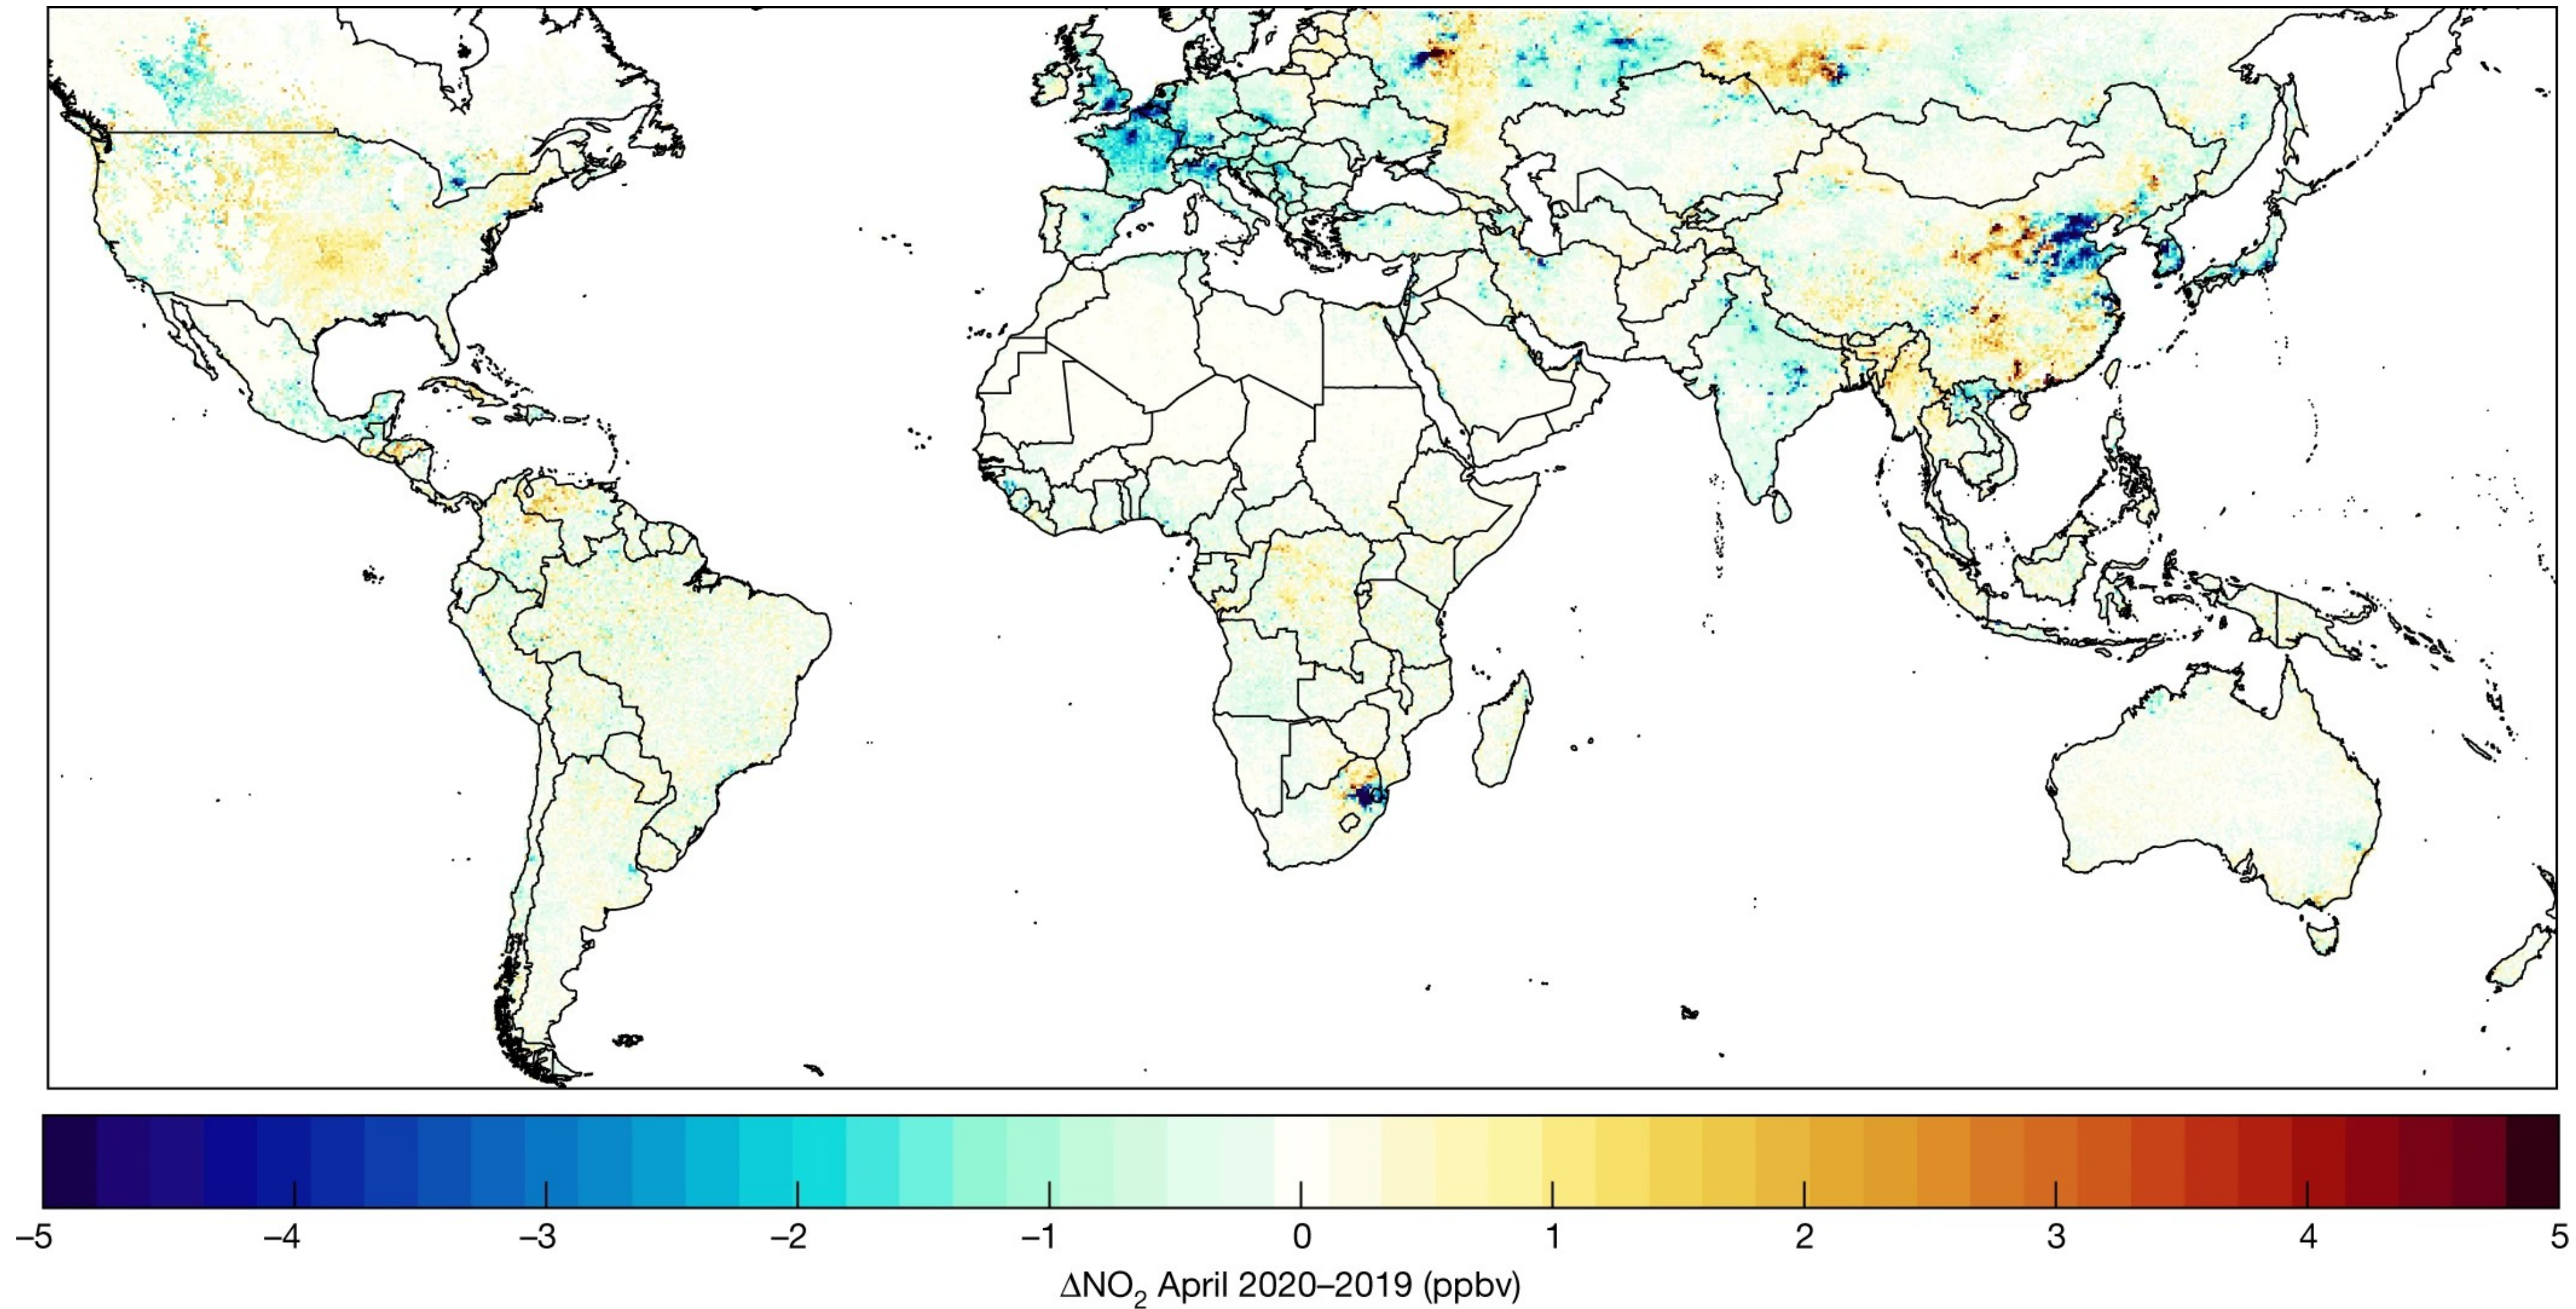

-D. P. Finch, P. I. Palmer, and T. Zhang (2022)

ATMOSPHERIC CONCENTRATION OF CO₂ DID NOT DECREASE DURING COVID

The carbon dioxide data on Mauna Loa constitute the longest record of direct measurements of CO₂ in the atmosphere.

ATMOSPHERIC CONCENTRATION OF NO₂ DETECTABLE USING SENTINEL 5 DATA

Differences in April mean ground-level NO₂ from 2020 to 2019 at 1x1 km² resolution

Source: Cooper et al. (2022)

DIFFERENCE IN SATELLITE OBSERVATIONS

- NO₂ (ESA Sentinel 5) - 2600 km swath, 7x3.5 km² per pixel
- CO₂ (NASA OCO-2) - 10 km swath, 1.29x2.25 km² per pixel

AUTOMATIC DETECTION OF NO₂ PLUMES

D. P. Finch, P. I. Palmer, and T. Zhang. *Automated detection of atmospheric NO₂ plumes from satellite data: a tool to help infer anthropogenic combustion emissions*. *Atmospheric Measurement Techniques*, 15(3):721–733, 2022.

MOTIVATION

- Objective CO₂ monitoring is needed to limit long-term temperature rise
 - Accuracy of self-reported emissions is questionable
 - Disproportionate role of few super-emitters
 - New emission sources appear
- Satellite observations are used to study point sources of CO₂ and methane emissions but not straightforward
- Idea: study traces of co-emitted gases, in particular, NO₂
- *Comment: this traces anthropogenic CO₂ emissions but not the lifecycle of CO₂ (oceans, forests, esp. tropics, poles)*

RESULT: CNN WITH 90% SUCCESS RATE CAPTURING 92% OF TOTAL CO₂ EMISSIONS

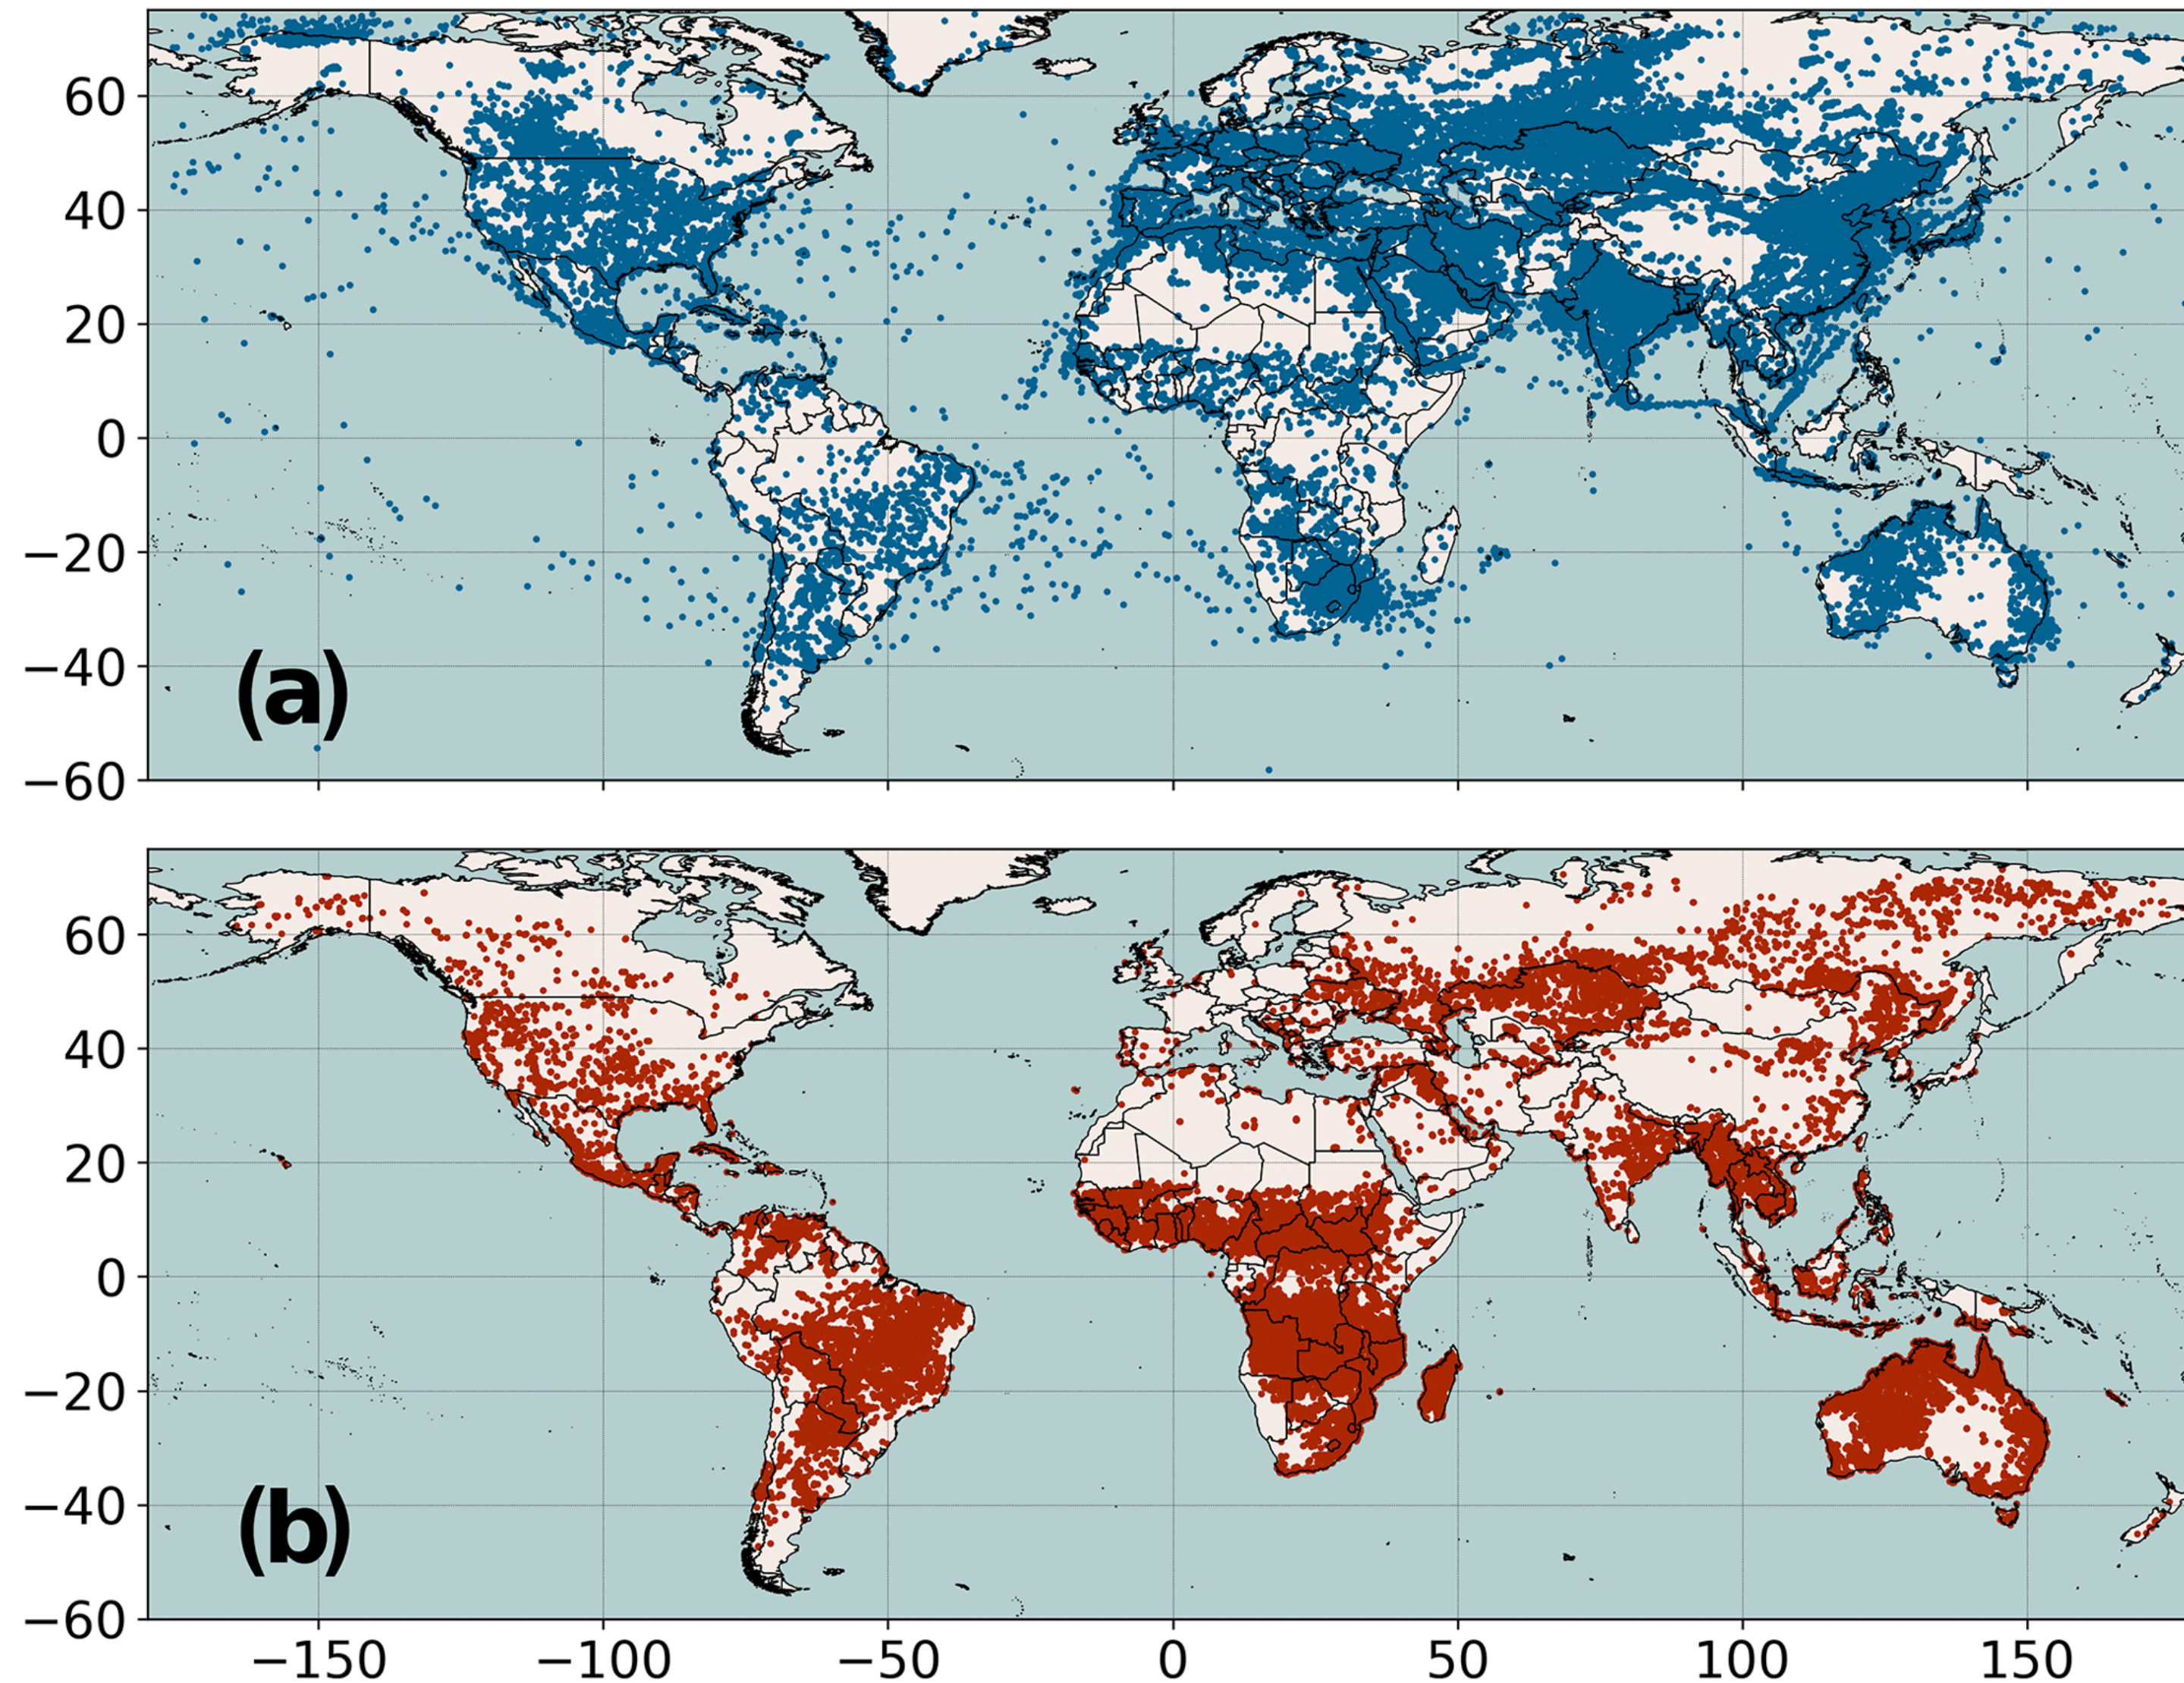

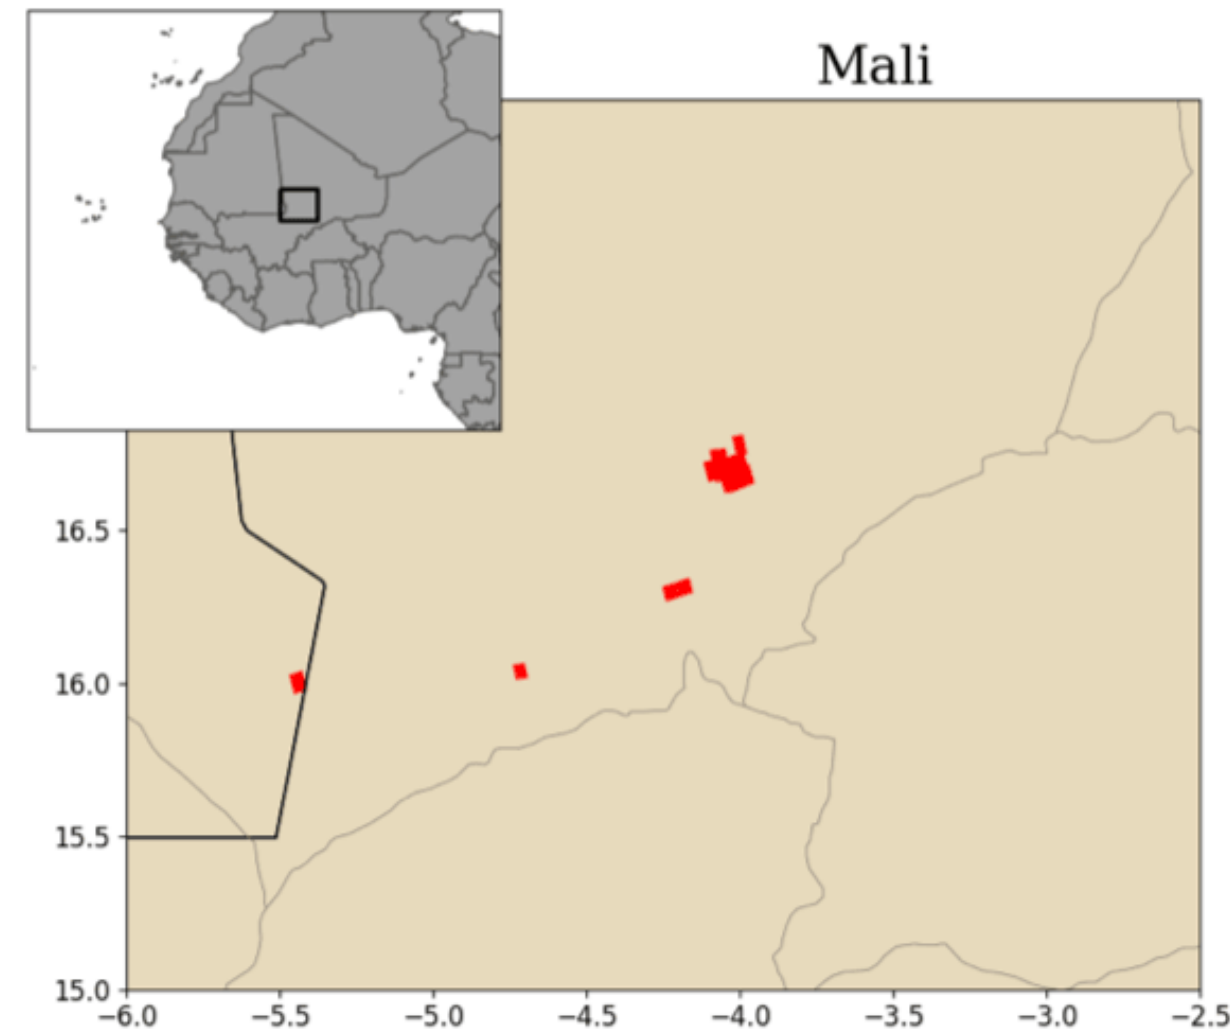

Figure: Geographical locations of individual TROPOMI NO₂ plumes identified using a CNN model, July 2018–June 2020. We attribute these plumes to (a) anthropogenic combustion or (b) biomass burning, depending on whether the plume falls within 15 km of the nearest VIIRS thermal anomaly measurement.

Source: Finch et al. (2022)

IDENTIFIED 4 CLUSTERS OF NO₂ EMISSION SOURCES NOT VISIBLE IN THE CO₂ DATASET

- Locations with plume clusters that are not associated with ODIAC CO₂ emissions
- The light-grey lines show major roads, and urban areas are shown by grey patches.
- Conjecture: true identification of otherwise unknown fossil fuel extraction and processing sites

Source: Finch et al. (2022)

DATA

- Sentinel 5 (TROPOMI) 6 000 images (28×28 pixel, approx. $266\text{km} \times 133\text{km}$) from July 2018 and June 2020, 310 000 individual NO_2 plumes
- VIIRS to separate sources of burning biomass (as proxy for fires)
- ODIAC Fossil Fuel CO_2 Emissions Dataset to verify sources of CO_2 emissions

Examples of individually normalised NO_2 plumes (Source: Finch et al., 2022)

“

NO₂ is widely assumed to be a robust proxy for combustion CO₂

-D. P. Finch, P. I. Palmer, and T. Zhang (2022)

For the full chemistry simulations, the NO_2 and NO concentrations became almost null 40 km away from the point source due to the formation of O_3 , whereas for the passive tracers simulation, the NO_2 concentrations remain significant even 57 km away from the source leading to a 200 % mismatch between the two configurations.

-I. Cheliotis et al. (2023)

IDEAS: HOW WOULD YOU RESOLVE THE ISSUE OF IDENTIFYING NO₂ PLUMES?

- Data sources
- Data collection methods
- Other learning algorithms

DROP-OUT

(a) Standard Neural Net

(b) After applying dropout.

-
- Reduce overfitting by randomly dropping units during the training of a neural network

Left: A standard neural net with 2 hidden layers.

Right: An example of a thinned net produced by applying dropout to the network on the left. Crossed units have been dropped. Source: Srivastava et al.

(2014)

PAIRS: WHAT OTHER RESEARCH QUESTIONS COULD YOU STUDY USING SATELLITE NO₂ DATA?

- Climate action
- Your domain

LEARNING MATERIALS FOR CNNs

- CS-EJ3311 - Deep learning with Python (2023)
 - Online lecture available on MyCourses
 - Detailed Jupyter Notebook on the course's JupyterHub
- Basic tutorial: <https://www.tensorflow.org/tutorials/images/cnn> (also loaded on Aalto JupyterHub)
- Free access to books via O'Reilly: F. Chollet, “Deep Learning with Python” or A. Géron, “Hands-on Machine Learning with Scikit-Learn, Keras, and TensorFlow“
- Mathematical intro: Higham, Catherine F., and Desmond J. Higham. "Deep learning: An introduction for applied mathematicians." *SIAM Review* 61.4 (2019): 860-891.

BEFORE EXERCISE SESSION 2

- Try CNN tutorial ([JupyterHub/Assignment List/cnn-tutorial](#))
- Make sure plumes have random identifiers and the images are not corrupted
- If possible, upload one plume image today

Winter Satellite Workshop 2024

WITH REMOTE SENSING DAYS AND FINCOSPAR CONVENTION 17-
19 JANUARY 2024, ESPOO DIPOLI, FINLAND
