

# Groups

```
var Canvas = d3.select("body")  
                .append("svg")  
                .attr("width",100)  
                .attr("height",200)
```

```
var group = Canvas.append("g")
```

Create group element  
under which Canvas  
elements will be grouped

```
group.append("circle")  
        ...  
group .append("circle")  
        ...  
group .append("circle")  
        ...
```

# Transform (translate) “group”

Move group or an element  
vertically or horizontally

```
group.attr("transform", "translate(x,y)")
```

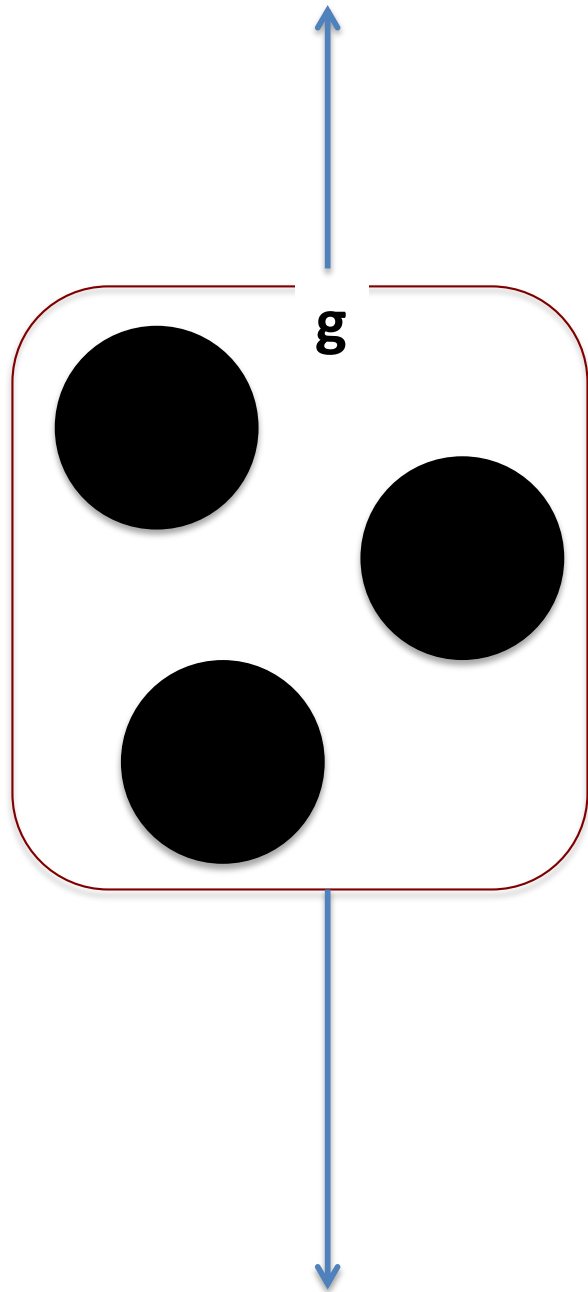

**x, y** – any number

`group.attr("transform", "translate(x, y)")`

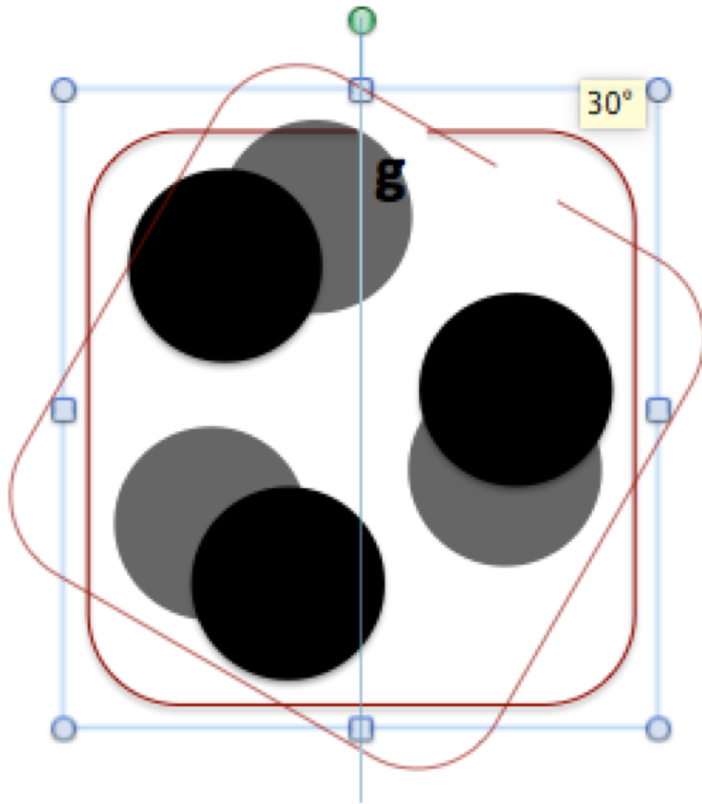

**x, y** – any number

`group.attr("transform", "translate(x, y )")`

# Transform (Rotate)

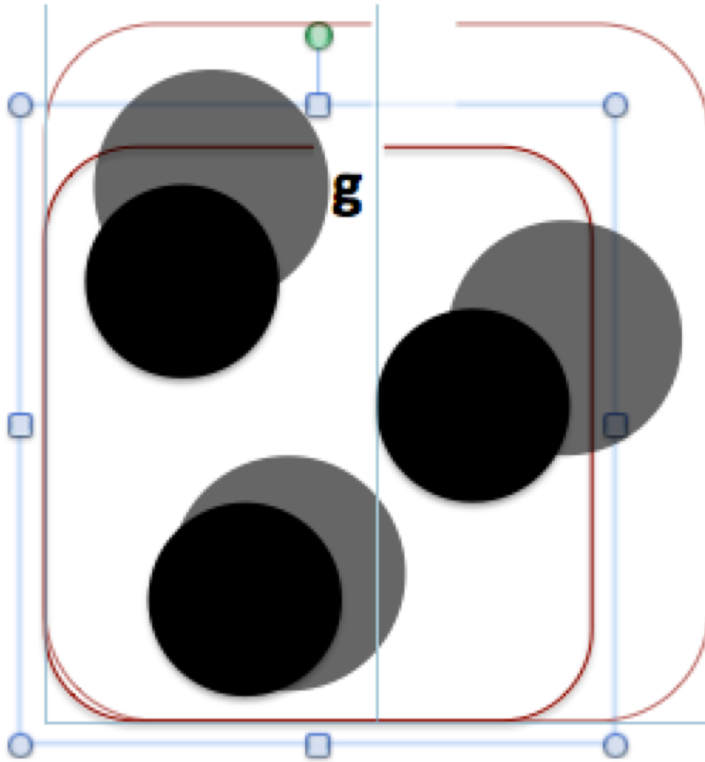

rotate group by specified degree

```
group.attr("transform", "rotate(degree)")
```

```
group.attr("transform", "rotate(30)")
```

$x$  – any positive decimal number

Increases/decreases size of the object

```
group.attr("transform", "scale(x)")
```

```
group.attr("transform", "scale(1.5)")
```

# Transform (skew)

Increases/decreases size of the object

```
group.attr("transform", "skewX(x)")
```

```
group.attr("transform", "skewY(y)")
```

```
group.attr("transform", "skewX(20)")
```

```
group.attr("transform", "skewY(20)")
```

# Combining transformations

```
group.attr("transform", "ALL DESIRABLE TRANSFORMATIONS")
```

```
group.attr("transform", "translate(0,100) rotate(30) scale(4)")
```

# Scales

```
var scale = d3.scaleLinear()  
    .domain([min datapoint, max datapoint])  
    .range([0, width]);
```

## Functions to transform data points

If we have data point 2.5 where will we place it on X axis

If we have data point 2.5 where will we place it on X axis?  
and If our data ranges from 2 to 102?

If we have data point 2.5 where will we place it on X axis?  
and If our data ranges from 2 to 102?

If we know ranges what positions on the screen datapoint will receive?

```
var scale = d3.scaleLinear()  
  .domain([min datapoint, max datapoint])  
  .range([0, width]);
```

```
scale(2.5)  
var numb = scale(2.5);  
console.log(scale(2.5));
```

# Create a Scatterplot

**Data Points**

**X**      **Y**

---

2      0

2      4

5      1

1      4

```
var scale = d3.scaleLinear()  
  .domain([min datapoint, max datapoint])  
  .range([height, 0]);
```

# We can also define color with scales

```
var colorScale= d3.scaleLinear()  
  .domain([-1, 1])  
  .range(['red','blue']);
```

```
var colorScale= d3.scaleLinear()  
  .domain([-1, 0, 1])  
  .range(['tomato','white','steelblue']);
```

# Drawing Bar Charts

```
var group = canvas1.append("g");
```

```
group.append("rect")
```

```
.attr("x", xScale(20))
```

```
.attr("y", yScale(8))
```

```
.attr("width", 20)
```

```
.attr("height", yScale(0) - yScale(8))
```

```
.attr("fill", "white")
```

```
.attr("stroke", "red")
```

We create beginning point  
at the end of the bar

End point at the bottom of the bar
