

**MEC-E5003 Fluid Power Basics**  
**Calculation Exercises 1**  
**Spring 2017**

**EXERCISE 1**

In the adjacent system, the lift cylinder hoisting the load  $m$  is operated by utilizing another cylinder (actuating cylinder).

**A.** Calculate the piston velocities for both cylinders.

**B.** What would be required for the velocities to be equal?

**C.** What is the maximum lifting height?

**D.** What would the maximum lift height be if the stroke length  $l_{s1}$  of the actuating cylinder would be doubled?

**E.** Calculate the pressure  $p_{s11}$  required for lifting the load (system assumed to be ideal; no losses).

Parameter values:  $q_{Vs11} = 10 \text{ l/min}$ ,  $d_{s11} = 63 \text{ mm}$ ,  $d_{s12} = 30 \text{ mm}$ ,  $d_{s21} = 40 \text{ mm}$ ,  $d_{s22} = 25 \text{ mm}$ ,  $l_{s1} = 250 \text{ mm}$ ,  $l_{s2} = 500 \text{ mm}$  and  $m = 5000 \text{ kg}$ .

**EXERCISE 2**

Calculate the piston velocities  $v$  and the maximum force outputs  $F$  of differential cylinder with the three given connection variants. Pump output is  $q_{v1} = 300 \text{ cm}^3/\text{s}$  and the system pressure is limited to 100 bars. The piston areas are  $A_1 = 100 \text{ cm}^2$  and  $A_3 = 50 \text{ cm}^2$ .

### EXERCISE 3

The piston velocity in adjacent system is required to be  $v = 0.5 \text{ m/s}$  in the shown direction. Pump produces flow  $50 \text{ l/min}$ . The cylinder is frictionless and leakage free.

Calculate the external load force  $F$  of the cylinder in cases where the pump outlet is connected tank line through:

- A. one restrictor
- B. two restrictors in series
- C. two parallel restrictors

$A_1 = 0.003 \text{ m}^2$ ,  $A_2 = 0.001 \text{ m}^2$ ,  
 $d_k = 2 \text{ mm}$ ,  $C_q = 0.7$  and  $\rho = 860 \text{ kg/m}^3$ .
