

1 Lectures

Class sessions:

- Lecturer: Fabricio Oliveira (fabricio.oliveira@aalto.fi);
- Sessions:
 - Wed, 16:15h - 18:00h, Y205 (Lecture Hall C)
 - Thu, 14:15h - 16:00h, Y122 (Lecture Hall D)
- Office hours: Wed 14:00h - 15:00h (book beforehand), room Y219 (Otakaari 1).

Exercise sessions: there are 6 groups in a week. Please check Oodi to see what sessions you have enrolled to and times

1. Mikko Kaivola (H1)
2. Jussi Hakosalo (H2)
3. Nikita Belyak (H3)
4. Ellie Dillon (Head TA: ellie.dillon@aalto.fi) (H4)
5. Anton von Schantz (H5)
6. Pauliina Kärkkäinen (H6)

2 Course description

Mathematical optimisation is one of the cornerstones of fields such as Machine Learning, Artificial Intelligence, and Operations Research. Most decision support methods have, at some level, a mathematical optimisation method at its core, and it is precisely these methods that we will learn in this course.

Mathematical optimisation is a powerful framework in which one seeks to find variable values within a domain that maximise (or minimise) the value of a given function. Using the analogy that variables represent decisions or parameters to be defined and the function is a measure of performance, one can use that framework to support decision making in a wide range of applications, from planning industrial chemical plants to training models that learn from data.

In this course, the student will learn the basic optimisation theory, how to formulate problems and how they can be solved. Linear, integer, and nonlinear optimisation will be covered in the course. At the end of this course, it is expected that the student will be capable of analysing the main characteristics of an optimisation problem and decide what is the most suitable method to be employed for its solution.

3 Learning outcomes

Upon completing this course, the student should be able to

- understand how several important problems arising from diverse fields can be cast and solved as optimisation problems;
- know the main techniques for solving optimisation problems and how to apply them in practice;
- know how to use optimisation software for implementing and solving optimisation problems.

4 Teaching methods

The course will be taught by a composition of the following methods:

- lectures;
- guided self-study;
- exercises.

5 Exercise sessions

For each lecture, the students will receive a list with 2 demos plus 5 exercises. In the exercise sessions, the TA's will present the solution of two demos. After that, the space will be used for the students to do exercises individually or in group and ask for the help of the TA's, if needed. Solutions for these exercises will be provided, however complete demonstrations will only be provided for the demos.

The students can attend any of the 6 exercise sessions for a given class. In case of space limitations, preference will be given for those enrolled in that session.

6 Assessment

The final grade is given by a final exam at the end of the course. Bonus points will be awarded for homework assignments and other activities. The exam will be graded in an scale of 0-100. The final grade will be calculated as

$$\text{Exam grade} + \text{Bonus points}$$

The conversion scale for to the 1-5 scale is as follows.

1-5	0-100
Fail	0-50
1	51-60
2	61-70
3	71-80
4	81-90
5	91-100

Table 1: Conversion from 0-100 to 1-5 scale

6.1 Exam

The exam will consists of questions similar to the exercises provided and solved in the exercise sessions. Full instructions concerning the exam format and a revising guide will be provided during classes.

6.2 Homework assignments

Every week, the students will have the opportunity to do two exercises and submit their answers online via MyCourses. Each correct exercise is worth **one point**, totalling 10 extra points.

6.3 Other bonus points

During the course, those taking part in additional activities will be granted extra bonus points. These will be announced throughout the course.

7 Course material

Main study material: lecture notes, exercises, homework assignments, course book.

Main course book: *H. Taha, Operations Research, An Introduction. Pearson, 2017.* Auxiliary course book: *W. Winston, Operations Research, Applications and Algorithms. Cengage, 2004*

8 Electronics policy

As a general rule, don't be rude! You are free to use electronic devices during class for note taking purposes. It is strongly recommended that note taking is by hand rather than using laptops.

9 Course schedule

A tentative schedule for the course is given. Content of each class may be adapted according to the pace of the classes.

Week	Lecture	Content
9	1	Admin./ Introduction + Formulation
9	2	Formulation + Graphical method
10	3	Simplex method
10	4	Simplex method II - special cases
11	5	Linear duality + sensitivity analysis
11	6	Integer prog. - formulation
12	7	Integer prog. - methods I + invited speaker
12	8	Unconst. opt. I: optimality conditions
13	9	Unconst. opt. II: gradient and Newton method
13	10	Const. opt. I: KKT conditions
14	11	Const. opt II: Interior point methods
14	12	Closing session
