# COEFFICIENT OF PARTIAL DETERMINATION AND PARTIAL CORRELATION <br> Tomi Seppälä <br> Aalto School of Business 

2018

Linear regression model

$$
Y=\beta_{0}+\beta_{1} X_{1}+\beta_{2} X_{2}+u
$$

$\mathrm{D}=\mathrm{RSS}\left(\mathrm{X}_{1}, \mathrm{X}_{2}\right)$ $\operatorname{TSS}(Y)=$
$A+B+C+D$
coefficient of determination: $\mathbf{R}^{\mathbf{2}}\left(\mathrm{X}_{1}, \mathrm{X}_{2}\right)=\frac{\mathrm{A}+\mathrm{B}+\mathrm{C}}{\mathrm{A}+\mathrm{B}+\mathrm{C}+\mathrm{D}}$

# COEFFICIENT OF partial DETERMINATION 

 between Y and X 2 , when given X 1 :Tells how many percentages of the remaining variation in $Y$ can be explained by $X_{2}$ after the effect of $X_{1}$ on $Y$ has been taken into account (effect of $X_{1}$ has been controlled for).

## COEFFICIENT OF partial CORRELATION between $Y$ and $X_{2}$, when given $X_{1}$ :

Tells the correlation between $Y$ and $X_{2}$ after the effect of $X_{1}$ on $Y$ has been taken into account (effect of $X_{1}$ has been controlled for).

## Formula to calculate partial correlation

Here all variations (ball sizes) are scaled to 1 (or 100\%): $a+b+c+d=1$

$$
r_{Y X 2 \mid X 1}=\frac{r_{Y X 2}-r_{Y X 1} \cdot r_{X 1 X 2}}{\sqrt{\left(1-r_{Y X 1}^{2}\right)\left(1-r_{X 1 X 2}^{2}\right)}}
$$

## Example: consider the following correlation matrix

|  | Y | X 1 | X 2 |
| :---: | :---: | :---: | :---: |
| Y | 1 | 0.6 | 0.5 |
| X 1 | 0.6 | 1 | 0.7 |
| X 2 | 0.5 | 0.7 | 1 |

Partial correlation between Y and $\mathrm{X}_{2}$, when given $\mathrm{X}_{1}$ :

$$
r_{\mathrm{YX} 2 \mid \mathrm{X} 1}=\frac{0.5-0.6 \cdot 0.7}{\sqrt{\left(1-0.6^{2}\right)\left(1-0.7^{2}\right)}}=0.35
$$

Time Series model, eg. AR(2)
$\mathrm{Y}_{\mathrm{t}}=\phi_{1} \mathrm{Y}_{\mathrm{t}-1}+\phi_{2} \mathrm{Y}_{\mathrm{t}-2}+\mathrm{u}_{\mathrm{t}}$
$\mathrm{D}=\operatorname{RSS}\left(\mathrm{X}_{1}, \mathrm{X}_{2}\right)$

COEFFICIENT OF DETERMINATION: $\mathbf{R}^{2}\left(\mathrm{Y}_{\mathrm{t}-1}, \mathrm{Y}_{\mathrm{t}-2)}=\right.$

$$
\frac{\mathbf{A}+\mathrm{B}+\mathrm{C}}{\mathrm{~A}+\mathrm{B}+\mathrm{C}+\mathrm{D}}
$$

## COEFFICIENT OF partial DETERMINATION

 of order 2 is the coefficient of determination between $Y_{t}$ and $Y_{t-2}$, when given $Y_{t-1}$ :$$
\tau_{22}^{2}=\frac{B}{B+D}
$$

Tells how many percentages of the remaining variation in $Y_{t}$ can be explained by $Y_{t-2}$ after the effect of $Y_{t-1}$ on $Y_{t}$ has been taken into account (effect of $Y_{t-1}$ has been controlled for).

## COEFFICIENT OF partial AUTOCORRELATION of order 2

is the partial correlation between $Y_{t}$
 and $Y_{t-2}$, when given $Y_{t-1}$ :

Tells the autocorrelation between $Y_{t}$ and $Y_{t-2}$ after the effect of $Y_{t-1}$ on $Y_{t}$ has been taken into account (effect of $Y_{t-1}$ has been controlled for).

## $\tau_{22}$

## Partial autocorrelation of order 2

Same formula as for cross sectional variables!
But simplifies in this case if the process is stationary! This formula works for any stationary process

$$
\tau_{22}=\frac{\tau_{2}-\tau_{1}^{2}}{1-\tau_{1}^{2}}
$$
