

The literature review (LR), also known as ‘**Related Work**’, ‘**Theory**’, or even ‘**Background**,’ should provide a *summary* of the subfield that you are working in, as well as show the *context* for your work. In this chapter, you **discuss** related work done by earlier researchers, **explain** how your thesis is linked to this earlier work, and **justify** why this knowledge is important for carrying out the aim that you promised at the end of your introduction in Chapter 1.

## 1. What, why, where, how?

### Discussion

How would you answer these questions?

- 1.1 **What** is a literature review?
- 1.2 **Why** do you need to review [the literature](#)? What is the **function** of a LR?
- 1.3 **Where** will you put it in your thesis?  
**What** is the **difference** between the information reviewed in the Introduction chapter and that in the Literature review chapter?
- 1.4 What **title** will you give you LR chapter?
- 1.5 **What strategy** will you use to **organize** this information?

## Why review the literature?

A review of the literature can have any of the following functions:

- To provide background information needed to **find a solution** to the problem promised in the introduction chapter
- To **display** (give evidence) that you are **familiar** with *earlier solutions* and/or *state-of-the-art technology* relevant to your topic
- To **justify** the **approach** or **method** that you will use for developing your solution
- To show how your thesis is **linked to previous research** (Is it continuing from where earlier research ended?)

The review traditionally provides a **historical overview** of the theory and the research literature, with a special emphasis on the literature specific to developing the solution in your thesis. It serves as well to support the argument/proposition behind your thesis, using evidence drawn from authorities or experts in your research field.

## How to display knowledge?

The review must be shaped by a focus on key areas of interest, including research which provides a background to the topic. It should also **be selective**. A common mistake in writing the review is to comment on everything you have read regardless of its relevance. In your writing it is useful to **think of the review as a funnel** - start wide with the overview (See [Section 1.4](#)) and then quickly narrow into discussing the research that relates to your specific topic.

Another way of looking at the process, particularly if you are examining several topics (or variables), is to think of yourself as a film director [2]. Provide your audience with

- **long shots** to provide a solid sense of the background
- **middle distance shots** where the key figures and elements to be examined are brought clearly into view
- **close-up shots** where the precise focus of your work is pinpointed

'Literature' can include a range of sources:

- Journal articles
- Conferences proceedings
- MSc Theses and PhD Dissertations
- Government reports, technical standards, patents and reports from other bodies

A number of these may be on the Internet. You should therefore approach such material with the same critical eye as you would approach printed material.

## 2. What do supervisors want?

A review of the literature should...

- demonstrate that you have a deep understanding of
  - the **key concepts/studies/ models** related to solving the problem motivating your thesis
  - the **history** of your research area and any related **controversies**
- clarify important **definitions/terminology**
- further develop the **research ‘gap’** stated in the **Introduction**
- narrow the **problem** in order to make the study feasible

To give you some sort of idea of what your professors are looking for when evaluating your review of the literature, read this extract for ‘**Command of the topic**’ published in *Guideline for Master’s Thesis Evaluation* (2012) by the School of Electrical Engineering at Aalto University.

<b>Excellent (5)</b>	The cited works have been <i>selected</i> not only <i>appropriately</i> but <i>critically</i> ; the number of relevant works cited is <i>sufficient</i> , consisting primarily of <i>high-quality scientific publications</i> (journals or other refereed forums). <b>The [thesis] results have been evaluated in the light of the cited works and in that of prior research and theories on the topic.</b> In addition, the student demonstrates deep understanding of the research topic.
<b>Very good (4)</b>	The thesis combines the cited works and empirical data <i>consistently</i> and clearly. The cited works consist primarily of <i>high-quality scientific publications</i> (journals, other refereed forums), which are sufficiently numerous and appropriately chosen. The student demonstrates good command of the research topic.
<b>Good (3)</b>	The student demonstrates good command of the relevant literature and background material, and has applied them appropriately, but <b>the connection between the background material and the empirical data is not necessarily made sufficiently explicit.</b>
<b>Very satisfactory (2)</b>	The references are <b>few or of poor scientific quality</b> . There are notable shortcomings in the referencing. Source evaluation is lacking and the bibliography contains errors.
<b>Satisfactory (1)</b>	The references are too few, they are of <b>poor scientific quality or ill-suited</b> for the thesis. There are significant shortcomings in the command and referencing of the literature and prior research on the topic, and the bibliography contains errors.

## 3. Avoiding Plagiarism

Many students mistakenly believe that to write about a topic, they must have something “original” to say. However, in science, knowledge is always the result of earlier work by other people. Since these ideas are not your own, it is vital that you acknowledge the original sources of your information. By doing so, you do not weaken your ideas, but instead you strengthen the credibility of your writing, and actually demonstrate to your teacher or professor that you have done the necessary background reading and study that are so central to a university education. Therefore, in your writing at the university, you should aim to **cite** your sources as much and as often as possible. This also helps you to avoid plagiarism.

### What is ‘plagiarism’?

**Plagiarism** is presenting an **idea, text, picture, piece of code** or **other work** created by someone else as your own. Plagiarism is defined at Aalto University as

If **only a few words** or **the word order has been altered**, the text is **not** considered to be an independent contribution or product of independent thinking. In addition, **closely following** the **argumentation or text structure** of someone else may constitute plagiarism.

(Aalto University Code of Academic Integrity and Handling Violations Thereof<sup>1</sup>, 2013)

### Who is speaking (Voice)?

In academic writing, it is vitally important that you distinguish whether it is “**you**” or the voices of “**others**” who are speaking. You can make this clear through the use of **metatext** (metatext), **citations** to the original sources, and even the **tense** used in the text. Without these ‘*clues*’, your reader will be unable to determine which information introduced in your text are your own ideas, opinions, claims and observations, and which are those of other writers and past researchers.

The main function of **citations** is to clearly separate and mark the writer’s thought from those of other sources that are brought into the text. Your citations should make it possible for the reader to easily follow and conclude at any given time **whose** “**voice**” is speaking through your text. Voice in academic text can take three forms [3]:

#### 1. The shared general voice of your field

The *general knowledge* that is widely accepted throughout your field of study

#### 2. The voice of the source cited

The *ideas, wording* and *products* of others’ work that you have introduced into your own text

#### 3. The voice of the writer

Your own *thoughts, opinions, comments* and *insights* expressed in the text

### 3.1 How to avoid plagiarism?

1. **Summarise** or **paraphrase** (i.e., use your own words) ideas and information obtained from a source.
2. **Cite** the original sources within your text (e.g., *Smith et al. (2012)* or [5])
3. Write clear, complete **references** describing sources in your **Bibliography/ References**.

Citing sources. Wikipedia. [Online] Available (2015, February 24)  
 from: [http://en.wikipedia.org/wiki/Wikipedia:Citing\\_sources](http://en.wikipedia.org/wiki/Wikipedia:Citing_sources)

4. In engineering fields, **avoid quoting**, but if you do use a short extract from another writer's work, place the words within **quotation marks** [" "] and **cite** the source either before or after the quote.
5. Distinguish between (1) **your own ideas**, (2) **common knowledge** and (3) the **individual work or accomplishments** of earlier people. Reference to a source is not needed if a piece of information is considered *shared common knowledge* (i.e., *general common knowledge* or *field-specific common knowledge*).

As shown in Table 2, three strategies are commonly used to avoid to avoid plagiarism. However, science and technology only use summarizing and paraphrasing for reporting the work of others.

**Table 2: Three strategies for avoiding plagiarism**

<b>Quotations</b>	<b>Summarising</b>	<b>Paraphrasing</b>
match the original source <i>word-for-word</i>	does <b><u>not</u></b> match the source text <i>word-for-word</i>	does <b><u>not</u></b> match the source text <i>word-for-word</i>
are usually very <i>short</i>	presents a <i>broad overview</i> of the <i>main idea(s)</i> in your own words	conveys the information/ideas from a source in <i>your own words</i>
are placed within <i>quotation marks</i> [" "]	always much <i>shorter</i> than the original	changes the <i>words</i> or <i>phrasing</i> of the text but fully maintains the original meaning, but <b><u>not</u></b> <i>structure</i>
must be attributed to the original source, <b><u>not</u></b> <i>secondary sources</i> , such as Wikipedia	must be attributed to the original source, <b><u>not</u></b> <i>secondary sources</i> , such as Wikipedia	must be attributed to the original source, <b><u>not</u></b> <i>secondary sources</i> , such as Wikipedia

# Exercise 1

As shown in Turnitin (Fig. 1.1), the first paragraph of this student's extended definition was a **word-by-word plagiarism** of work written by **Tohyama and Yamaguchi (2009)**. How would you paraphrase (re-write in your own words) their text?

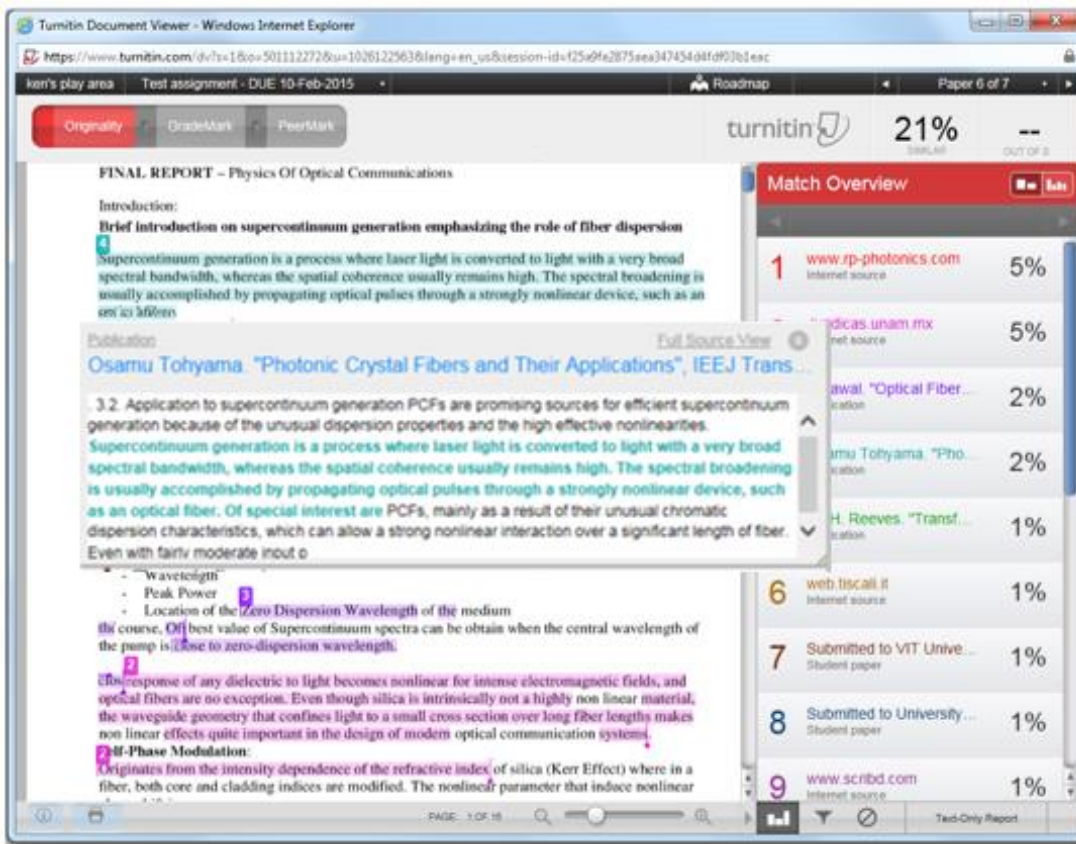

Figure 8: View of Turnitin feedback showing sections plagiarized from other sources

**O. Tohyama and S.-I. Yamaguchi.** “Photonic Crystal Fibers and Their Applications,” *IEEJ Transactions on Electrical and Electronic Engineering*, vol. 4, no. 6, pp. 704–709, Nov. 2009

<sup>1</sup>Supercontinuum generation is a process where laser light is converted to light with a very broad spectral bandwidth, whereas the spatial coherence usually remains high.

<sup>2</sup>The spectral broadening is usually accomplished by propagating optical pulses through a strongly nonlinear device, such as an optical fiber. <sup>3</sup>Of special interest are PCFs.

## Your version:

.....

.....

.....

.....

## Citation Styles

Four formats are commonly used in science and engineering for citing sources. In addition, individual fields differ in their preference between **author-** and **information-prominent** styles.

**Table 3:** Four formats applied using author- and information-prominent reporting styles

Formats	Author-prominent style	Information-prominent style
Author-date	<p><u>Smith</u> (2012) showed that...</p> <p>It was shown by <u>Smith</u> (2012) that ...</p> <p>Several recent <u>studies</u> (Smith, 2012; Virtanen et al., 2005; Chao and Wang, 2011) have suggested that...</p>	<p>The <u>theory</u> was first proposed for linear systems (Smith, 1987).</p>
bracketed number	<p><u>Smith</u> [2] showed that...</p> <p>In [2], it was shown that...</p> <p>Several recent <u>studies</u> [1], [3], [4] have suggested that...</p>	<p>The <u>theory</u> was first proposed for linear systems [1].</p>
superscripted number	<p><u>Smith</u><sup>2</sup> showed that...</p> <p>It was shown by <u>Smith</u><sup>2</sup> that ...</p> <p>Several recent <u>studies</u><sup>1,3,4</sup> have suggested that...</p>	<p>The <u>theory</u> was first proposed for linear systems.<sup>1</sup></p>
parenthetic number	<p><u>Smith</u> (2) showed that...</p> <p>It was shown by <u>Smith</u> (2) that ...</p> <p>Several recent <u>studies</u> (1), (3), (4) have suggested that...</p>	<p>The <u>theory</u> was first proposed for linear systems (1).</p>

## Reference Styles

The style used to create references and in-text citations to these references differ from one field of study to another. The two most commonly used citation style in the engineering fields are **IEEE** and **Harvard**. Examples are shown in Figure 9.

- **IEEE (numerical)**

O. Tohyama and S. Yamaguchi, "Photonic Crystal Fibers and Their Applications," *IEEJ Trans Elec Electron Eng*, 4: 704-709, 2009. doi:[10.1002/tee.20468](https://doi.org/10.1002/tee.20468)

- **Harvard (Author-date)**

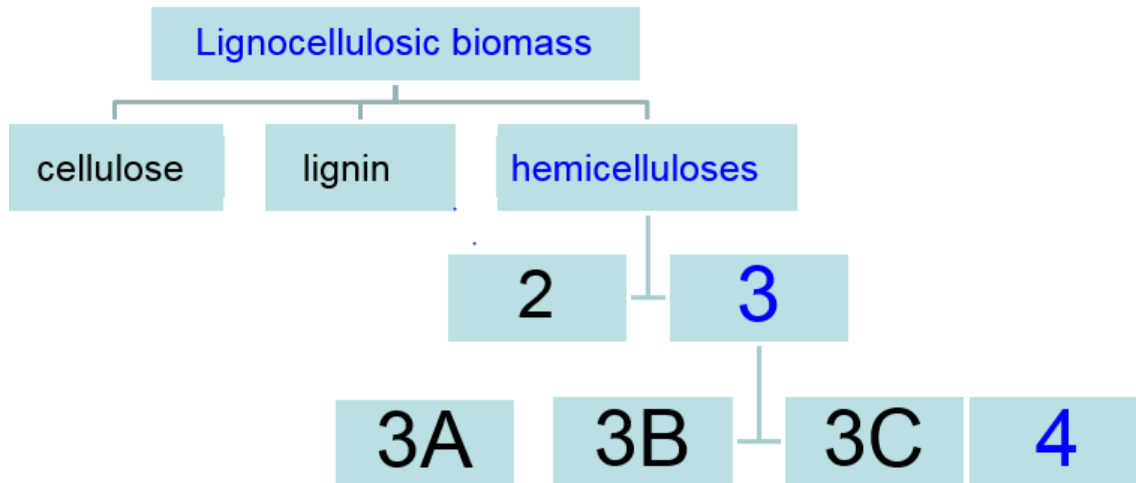

Tohyama, O. and Yamaguchi, S. (2009), Photonic Crystal Fibers and Their Applications. *IEEJ Trans Elec Electron Eng*, 4: 704-709. doi:[10.1002/tee.20468](https://doi.org/10.1002/tee.20468)

**Figure 9:** the two most common referencing styles used in the engineering fields at Aalto University.

## CLASSIFICATION-DIVISION

A key strategy for displaying knowledge, as well as moving down “the funnel,” is to classify and divide your topic into its components or areas of enquiry. Not all of these areas should be given equal weight in your review. Strategically order these classes or areas least-to-most relevant in terms of the objectives of your own study:

<sup>11</sup>Lignocellulosic biomass comprises an intricate matrix composed of **three constituents**: cellulose, lignin, and hemicelluloses.

Note in the above figure how the classification-division strategy allows the writer to narrow the topic by first introducing with a **colon [:]** the three main components of lignocellulosic biomass. Thereafter, each component is briefly discussed moving in increasing order of its relevance to the problem to be solved in the thesis, eventually ending by discussing **hemicelluloses**, which in turn is then further divided and sub-divided into its subcategories, until the main focus of the thesis is eventually arrived at in **Topic 4**. This strategy enables the writer not only to display a deeper understanding the topic, but also to justify a certain method, theory or approach used in the thesis.

Such lists are fundamentally important not just for reporting theory and earlier research, but also for listing examples. The following pages describe the most common structures and language for introducing items in lists, as well as the correct punctuation for creating these lists.

## 4. Introducing items in a list

In order to introduce *items in a list*, a sentence must meet two requirements. First, the sentence needs to have a **superordinate term**, which **links forward** and **describes** the 'class of things' to which the listed items belong. It is also important to decide on whether these items form a 'closed' or an 'open' set, as this determines the structure and punctuation used to introduce these listed items.

### 4.1 CLOSED SET

When the listed items comprise a **closed set** (i.e., the only items in that 'class of things'), use Strategy 1.1 or 1.2.

#### 4.1.1 Closed set: **Number** + **superordinate** + colon [:] + *list of items*

A master's thesis can typically be divided into **five chapters**: *an introduction, literature review, methods, results and conclusion.*

#### 4.1.2 Closed set: **Superordinate** + the verb **to consist of** + *list of items*

The decision **variables** for optimization **consisted of** *temperature, volumetric flow and emission rate.*

### 4.2 OPEN SET

However, if the listed items form an **open set** (i.e., examples of some of the items that could be included in that group), then use Strategies 2.1-2.3.

#### 4.2.1 Open set: **Superordinate** + **such as** + [*examples*]

Today's mobile lifestyle would not be possible without **vehicles**, **such as** *automobiles, buses, trams and aircraft.*

#### 4.2.2 Open set: **INDEFINITE QUANTIFIER** + **superordinate** + **including** + [*examples*]

A new energy tax will be levied on **MANY** motorised **vehicles**, **including** *automobiles, lorries and motorcycles.*

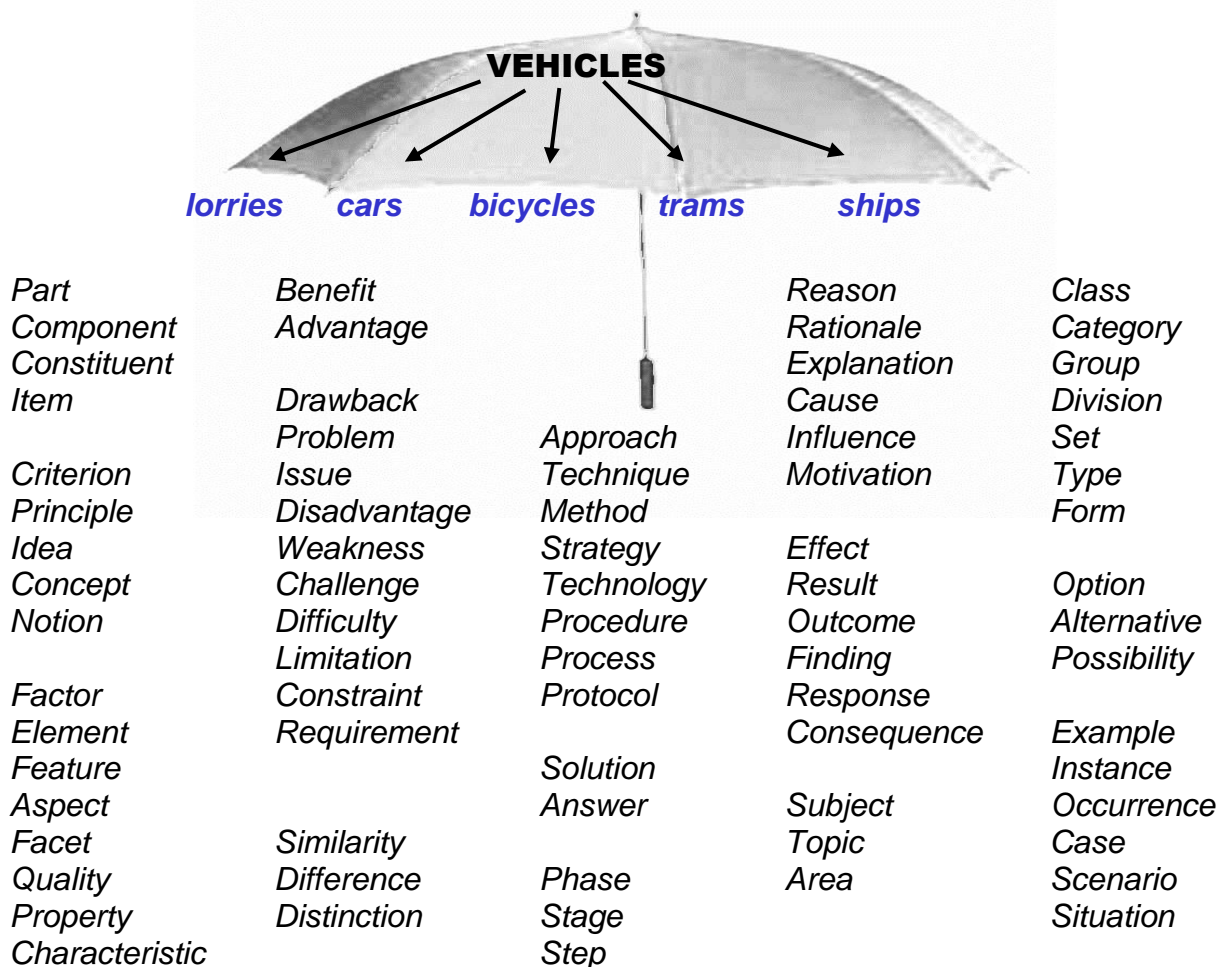

#### 4.2.3 Open set: **Superordinate** + the verb **to include** + [*examples*]

The decision **variables** for optimization **included** *temperature, volumetric flow and emission rate.*

# Superordinate Terms

Similar to closed lists, open lists require a **superordinate term** to introduce the example items in the list. Since identifying the correct superordinate can take some effort, most of the above problems can be attributed to either weak language skills, unfamiliarity with the vocabulary of the field, or simply laziness on the part of the writer. Superordinate terms (often also called *'hypernyms,' 'anaphoric nouns,'* or *'discourse-organizing words'*) are nouns that can be used to stand for an entire **'class'** or **'category'** of things. Thus, a superordinate term acts as an **'umbrella' term** that includes within it the meaning of other words. For example, 'vehicle' is the *superordinate concept* for 'lorry', 'automobile', 'bicycle', and 'tram'.

Superordinate terms play an important role in promoting 'cohesion' by providing writers with a more explicit means than would be possible using only pronouns (*it, they, this, these, those*) for linking their ideas either back to earlier presented text, or forward to upcoming information. Superordinates tell the reader what to expect when they occur before an idea. In this function, superordinate terms serve as the **'class'** in **definitions**, describe the *items* and *examples* presented in **lists**, and are important in creating **topic sentences** (See [Appendix 5](#)). The most common superordinates used in engineering are listed below in Figure 1.

**Figure 1:** Common superordinate terms used in engineering, grouped according to functional areas.

## 4.1 Closed-Set Lists

When describing or analyzing concepts for a literature review or a theory chapter, you will often need to either divide a concept into its *components* or classify previous solutions into *categories* based on *criteria* relevant to the aims of your research, since complex subjects are more easily understood when broken down into smaller groups. For this purpose, engineering texts tend to use a **classification-division** organizational structure, which first introduces the categories or sub-classes of the concept as either a **formatted** or **unformatted list**, and then describes each category in greater detail, preferably in the same order as presented in the introductory list. *Formatted* lists are those that present the items as a vertical list using either bullets [ • ], numbers [ 1. , 2. , 3. ,... ] or letters [ a., b., c.,... ], whereas *unformatted* lists present the listed items as a horizontal list.

### 4.1.1 Introducing a closed set using a colon [:]

Although an **Em dash** [—] or a **comma** [,] are widely used in the fields of **art**, **business** and the **humanities** for introducing items in a list, avoid using these in science and engineering. In science and engineering, a **closed set** of items is typically introduced with a **colon** [:] using the following structure and vocabulary (Fig. 2):

[TOPIC]	has been *can be	divided classified categorized grouped	into	[HOW MANY?] the following	subdivisions: classes: groups:	[item <sub>1</sub> ], [item <sub>2</sub> ], <b>and</b> [item <sub>3</sub> ].
---------	---------------------	---	------	------------------------------	--------------------------------------	--

\*Using **can** indicates that this is the writer's own interpretation, whereas the *present perfect tense* (i.e., **has been**) shows that the classification is widely accepted among the scientific community.

**Figure 2:** Typical sentence structure and vocabulary for presenting a closed set using a colon [:].

In order to use a colon [:], the text before the colon must contain three essential components:

- 1) A grammatically **complete sentence** before the colon [:]
- 2) A qualifier, either (a) a **numerical quantity** announcing the number of items in the list, or (b) the expression "**the following**"
- 3) A **superordinate term** that identifies the category to which the listed items belong

As shown in Fig. 3, even the presentation of equations, where only one item is listed, requires a complete sentence, a qualifier (*the following*) and a superordinate term (*equation*) in order to use a colon [:]. In the example *without* a colon (right pane), note that a colon cannot be used, since the text before the equation does not form a complete sentence. Instead, the equation is integrated into the sentence and therefore requires a comma [,] after the equation and a period [.] at the end.

<p>The increased spectral efficiency of the system can be represented by <b>the following equation</b>:</p> $a = \frac{d_i(t)}{d_i}$	<p>The effective bulk-like second-order susceptibility of TMDs is obtained from the sheet susceptibilities <b>as</b></p> $ \chi_{\text{eff}}^{(n)}  = \frac{ \chi_s^{(n)} }{t},$ <p>where <math>t</math> is the thickness of the TMD monolayer, <math>\sim 0.65</math> nm.</p>
--	--

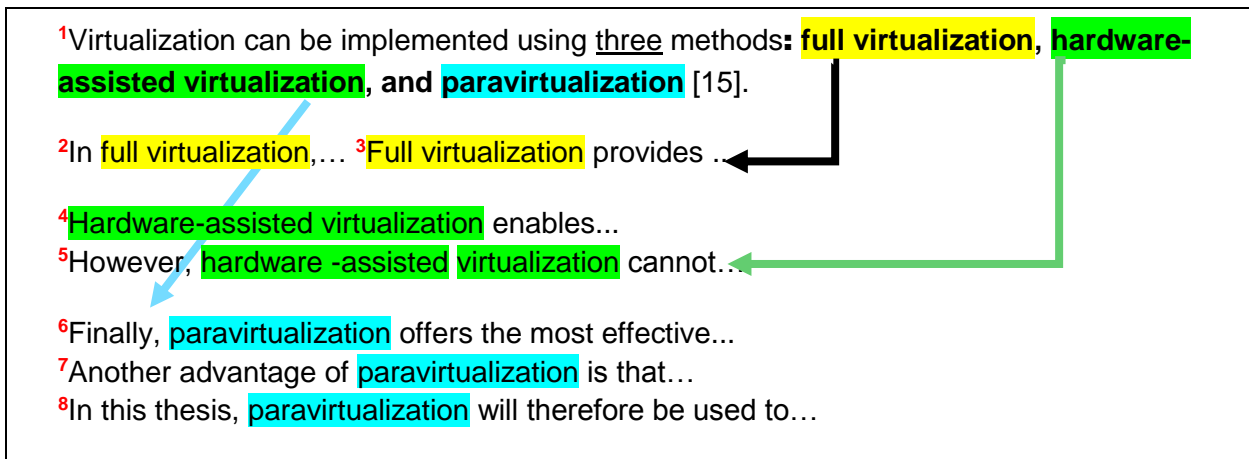

**Figure 3:** Presentation of an equation **with** (left pane) and **without** (right pane) a colon [:].

In Figure 4 below, note that the text before the colon [:] meets all three of the requirements for using a colon: (1) It expresses a **complete sentence**. In other words, it has a **subject** (“*This study*”), a **verb** (“*has*”) and a **complement** (“*three goals*”); (2) it also announces the **number** of items in the list; and (3) the text before the colon uses a **superordinate term** (“*goals*”) that answers the question *What are these items?*.

<b>UNFORMATTED LISTS</b>	<b>FORMATTED LISTS</b>
<p><b>Option 1</b> (Single sentence, colon, commas)            This study has <b>three goals</b>: To identify the stages in the pavement management process, to determine the factors leading to the evolution of application user interfaces, and to evaluate the implementation of these user interfaces in a case study.</p>	<p><b>Option 2</b> (topic sentence, colon, <u>no</u> commas)            This study has <b>three goals</b>:</p> <ol style="list-style-type: none"> <li>1) <b>To identify</b> the stages in the pavement management process</li> <li>2) <b>To determine</b> the factors leading to the evolution of application user interfaces</li> <li>3) <b>To evaluate</b> the implementation of these user interfaces in a case study</li> </ol>

**Figure 4:** The same closed set of items presented with a colon as an *unformatted* and *formatted* list.

In engineering, closed-set lists are often used as **topic sentences** (Appendix 5) that first **preview** the items and then afterwards discuss them in the **same order** as they appeared in the list. Therefore, it is also important to strategically order these items **least relevant** → **most relevant** in terms of your topic, as shown below in Fig. 5.

**Figure 5:** Strategic ordering of items in a list to allow placement of the the most relevant or important item at the end of the list, where it can be discussed at greater length and further divided into subtopics.

## 4.1.2 Introducing a closed-set without a colon

As can be seen from Figure 6, Options 3 and 4 both formulate the list as a single sentence. When “packing” a list into a single sentence, always use a **comma** [,] to separate each item in the list, remember to add **the word and** before the last item in the list, and end the list with a **full stop** (UK)/ a **period** (USA). However, note that no colon [:] can be used before the list, since the text introducing the list (i.e., “*This study aims to*”) does not form a complete sentence, nor does it have a superordinate.

UNFORMATTED LISTS	FORMATTED LISTS
<p><b>Option 3</b> (single sentence)</p> <p>This study aims <b>to identify</b> the stages in the pavement management process, <b>to determine</b> the factors leading to the evolution of application user interfaces, <b>and to evaluate</b> the implementation of these user interfaces in a case study.</p>	<p><b>Option 4</b> (single sentence integrating a bulleted list)</p> <p>This study aims <b>to</b></p> <ul style="list-style-type: none"> <li>▪ <b>identify</b> the stages in the pavement management process,</li> <li>▪ <b>determine</b> the factors leading to the evolution of application user interfaces, <b>and</b></li> <li>▪ <b>evaluate</b> the implementation of these user interfaces in a case study.</li> </ul>

**Figure 6:** The same closed set of items presented without a colon as an *unformatted* and *formatted* list.

The above examples illustrate the use of a colon to introduce items of the same status; in this case, the aims of a study. However, as mentioned earlier, another function of lists is to divide an entity into its parts, or to classify items into groups. This function is commonly referred to as **classification-division**. When using this pattern, inexperienced writers often over-rely on the use of the weak verb **to be** to describe the relationship between the parts and the whole. However, academic writing avoids using the verb **to be** in such cases. Figure 7 presents a list of the most common verbs used to replace the verb **to be** when introducing a closed set of items in a list (See [Verbs to replace weak verbs](#)).

### WRONG:

The decision **variables** for optimization **are** *temperature, volumetric flow, and emission rate*.

### BETTER:

The decision **variables** for optimization **consist of** *temperature, volumetric flow, and emission rate*.

<b>DIVISION</b> (WHOLE→PARTS)		
The proposed system	<b>consists of</b> <b>is composed of</b> <b>is comprised of</b> (USA) <b>comprises</b> (UK) <b>*is made up of</b>	an accelerometer, tilt sensor and gyroscope.
*Informal spoken form		

**Figure 7:** Verbs commonly used to replace the verb **to be** when introducing a closed set of components.

## 4.2 Open-Set Lists

Unlike a closed set of items, an **open set** suggests that more items could be added to the list than have already been stated. Closed sets are used to present **examples** to help the reader in understanding the concept or, in the case of a master's thesis, to demonstrate the depth of your understanding that concept. For this function, science has developed different language strategies for signaling that the ensuing information will provide examples. Table 1 shows some of the most common mistakes and how to correct them. Note that similar to structures used for introducing a closed set, presenting an open set of examples also requires a [superordinate term](#) that describes the class of things to which the listed items belong.

**Table 1:** Common problems when introducing examples (i.e., open set of items) and strategies to overcome them.

<b>Poor</b> (no superordinate)	<b>Better</b> (with superordinate)
<p><b>..., etc.</b></p> <p>These processes have employed <i>acid hydrolysis, chlorination, alkaline extraction, etc.</i></p>	<p><b>4.2.1 Superordinate + such as + [examples]</b></p> <p>These processes have employed <b>common chemical procedures, such as</b> <i>acid hydrolysis, chlorination, and alkaline extraction.</i></p> <p><b>4.2.2 QUANTIFIER + superordinate + including + [examples]</b></p> <p>These processes have employed <b>VARIOUS common chemical procedures, including</b> <i>acid hydrolysis, chlorination, and alkaline extraction.</i></p> <p><b>4.2.3 Superordinate + the verb to include + [examples]</b></p> <p><b>Common chemical procedures</b> employed in these processes <b>include</b> <i>acid hydrolysis, chlorination, and alkaline extraction.</i></p>

## 5. Metatext

The writer's own voice is most clearly spoken through the use of metatext, also commonly referred to as metatext. Metatext comprises the comments concerning the text made by the writer within the text: they give signals to the reader that explain the function or intention of the text, where the text is going, where it has gone, and what it has achieved so far. The author "intrudes" to guide the reader and, more importantly in the master's thesis, to explain and justify the process leading to the outcome of the thesis.

### *Starting with the top level this can apply to:*

- The whole thesis (*The focus of this thesis is...*)
- Another chapter (*The physical properties will be presented and analysed in Chapter 3*)
- The current chapter (*The rest of this chapter will examine...*)
- Another section (*In the previous section, it was demonstrated that...*)
- The current section (*This section introduces...*)
- Passage immediately preceding or following (*The objectives are as follows:...*)

### *More specifically, these reader directions can function to:*

#### 1. **OVERVIEW** (justification/content of current section/chapter)

<sup>1</sup>**In order to** explain the optimization model used for the design of fabric formed beams, three main principles need to be discussed: **X, Y, and Z**.

<sup>20</sup>**Having** established relations for the form-finding process, **the next section explains** an approximation of the beam's strength-based design.

<sup>36</sup>However, in order to **minimize** the cost of the cross-section, **the next section develops** a cost model.

#### 2. **REVIEW**

<sup>42</sup>**This chapter introduced** the main methodology for finding the form of a fabric subjected to hydrostatic pressure from a fluid.

<sup>43</sup>**An original approach was proposed** to use polynomial approximations of the dimensionless relationships for the optimization approach.

#### 3. **PREVIEW** (purpose/content of next section/chapter)

<sup>45</sup>**The next chapter will introduce** the optimization methods for the design of reinforced fabric formed concrete.

# Common Verbs in Chapter/Section Metatext

A quick-and-dirty analysis using **Google Scholar** < <http://scholar.google.fi> > revealed the following twenty-one verbs to be commonly used in **IEEE Journals** to describe the purpose of Chapter/ Sections. The verbs are arranged in descending order of frequency of occurrence (“hits”). The frequency of each verb was obtained by searching with the "wildcard" search phrase “**section \* VERB**”. For example, searching with the wildcard phrase “**section \* PRESENTS**” yielded the highest frequency at 296,000 occurrences.

<b>Chapter 2</b>	<b>presents</b>	[296,000 hits]	<b>MOST COMMON</b>  <b>LEAST COMMON</b>
<b>This chapter</b>	<b>describes</b>	[273,000 hits]	
<b>Section 1.3</b>	<b>reviews</b>	[205,000 hits]

## 5.1 Introducing and Summarizing Chapters

You need to keep two goals in mind when organizing your literature review: (1) you want your text to be as easy as possible for your supervisor to read, and (2) you also need to *explicitly explain* and **justify** how the information presented in your LR is *relevant*, *important*, and *necessary* to the aim that you described in the introduction to your thesis.

The **introductory paragraph** of your literature review chapter should not only introduce the **key terms** and **concepts** that will be discussed and defined, but it should also provide an **overview** outlining the structure of the chapter. Similarly, the **concluding paragraph** for each chapter should ideally provide a summary that does not simply list the contents of the chapter but should actually explain its relevance to your research—*why was this information important to know?* In addition to highlighting the relevance of the chapter, your concluding paragraph can also **preview** the topics of the next chapter and explain how they are connected to the current chapter. Figure 10 shows a typical example of an introductory paragraph

	Alexandr Vesselkov, "Forecasting of mobile handset feature diffusion: supply-related aspects," M.S. thesis, Dept. Elect. Eng., Aalto Univ., Espoo, Finland, 2014.
<b>Purpose of chapter</b>	<b>4 Evolution of mobile handset population in Finland</b>
<b>Justification</b>	<b>1</b> This chapter presents the results of quantitative study of mobile handset base evolution in Finland. <b>2</b> Analysis of the handset population <b>is necessary for</b> detecting and studying the development trends of the mobile handset market. <b>3</b> Understanding these trends, in turn, <b>is an important prerequisite for</b> improving the forecasting of mobile handset feature diffusion.
<b>Overview of structure and content</b>	<b>4</b> This chapter is organized as follows. <b>5</b> Section 4.1 presents the shares of different device types in Finland. <b>6</b> The phenomenon of the fragmentation of mobile handset population <b>is investigated in Section 4.2</b> . <b>7</b> Section 4.3 <b>discusses</b> the evolution of mobile handset base by manufacturer and operating system. <b>8</b> Finally, historical diffusion of mobile handset features <b>is analyzed in Section 4.4</b> .
	<b>4.1 Evolution of the shares of mobile device types</b>

**Figure 10:** Example introductory paragraph to a thesis LR in Electrical Engineering

Note how the writer explicitly justifies this chapter by referring back to the aim of the thesis (i.e., *improving the forecasting of mobile handset feature diffusion*). A typical strategy for linking the chapter contents to the thesis aim is to use either a **purpose clause** (in order to..., for + -ing) or a **cause-effect connector** (Since / Because / As).

**2**Analysis of the handset population **is necessary for detecting and studying**...

**2**Analysis of the handset population **is necessary in order to detect and study** ...

**2**The handset population is analyzed, **since** this will allow detection and study of...

## Exercise 2

What **information** has been used to organize these introductory and summarizing paragraphs in these two chapters from a master's thesis in civil engineering? What tenses have been used in each? Why?

Marwan Saredine. 2014. *Optimal Design of Fabric Formed Concrete Beams*, Master's thesis, Department of Civil and Environmental Engineering, Massachusetts Institute of Technology. Retrieved 6 March 2016: <http://dspace.mit.edu/handle/1721.1/90155>

### 3. METHODOLOGY

<sup>1</sup>This chapter will explain the two methods developed in this thesis for optimizing a reinforced fabric formed beam. <sup>2</sup>Initially the analytical optimization method is introduced which relies on solving a constrained non-linear optimization problem using Matlab. <sup>3</sup>Then the feasible region method is introduced which is a more direct and approximate method that could be more convenient for designers to use.

### 3.4 Summary of Contributions

<sup>37</sup>This chapter has introduced two main methods for the optimization of the cross-section of a fabric formed reinforced concrete beam. <sup>38</sup>The first method is the analytical optimization method that is an original way to deal with the problem from a constrained optimization point of view. <sup>39</sup>The second method is the feasible region method, which might prove to be a more user-friendly method that the designer could conveniently use without having to undergo the same level of computation required by the analytical optimization method. <sup>40</sup>The next chapter will look at a sample result of both of the methods just introduced.

### 4. RESULTS

<sup>1</sup>This chapter will consider a specific sample problem which is then solved using both the analytical optimization model and the feasible region model. <sup>2</sup>The results are also benchmarked against the output from the model introduced by Garbett, Darby, & Ibell (2010).

### 4.3 Summary

<sup>55</sup>The results chapter has benchmarked the two methods proposed for the optimum design of fabric formed beams with the method of Garbett, Darby, & Ibell (2010). <sup>56</sup>The chapter also proposes a rough estimation of about 55% in cost savings. <sup>57</sup>This approximation is not exact since only a total of three cross-sections were chosen and due to other assumptions which have been previously explained. <sup>58</sup>The next chapter will consider the topic of pre-stress design from a similar perspective to which the problem of reinforced concrete design was approached.

## 5.2 Topic Sentences

Another form of metatext is the topic sentence. Topic sentences are not only an important tool for maintaining cohesion but are also a cornerstone of reader-friendly writing. When reviewing previous literature, the writer needs to relate *what has been done (or proposed)* with *who has done (or proposed) it*. However, before starting to list individual studies and their authors, it is important that you first present the reason for introducing them. For this purpose, good writers use the following three sentence patterns as strategies for introducing research in a topic area.

### Strategies for introducing previous research:

5. {TIME} [INTENSIFIER] [RESEARCH ACTIVITY] has [VERB -ed] | [TOPIC]  
[PURPOSE]

Recently, much research has been devoted to improving the solubility and retrogradation of starches by reducing their molecular weight through chemical, physical, or enzymatic treatments (Becktel, 1959, Carrol et al., 1987 and Hebeda et al., 1990).

6. {TIME} [INTENSIFIER] progress has been [VERB -ed] in [TOPIC]

In recent years, much progress has been achieved in the development of biodegradable products using agricultural materials.

7. {TIME} [QUANTIFIER] [RESEARCH ACTIVITY] have (been) [VERB -ed] | [TOPIC]  
[PURPOSE]

A number of METHODS have recently been described to measure this property, including the Tarr-Baker gelometer (Bender, 2009) and the Herbstreith Pektinometer (Zedler, 2013).

Strategies 5-7 can serve as (1) a **topic sentence** that sets the scene for a listing of previous research work, in which each subsequent sentence uses an *author-prominent* strategy to support a claim made in the topic sentence; (2) as a “**bridge**” between two major topics; (3) as a quick summary describing the **current focus** of a research field [Move 1-3]; or (4) as the **first part** in a description of a **gap** in the introduction chapter [Move 2-2] by introducing a topic area that has already been filled by previous research, before going on to identify neglected areas that have received “little” or “no” attention in the literature. See [Appendix 5: Topic sentences \(Move 1-3\)](#) in our Mycourses class site for the specific language commonly used with these topic sentences.

Look at the following excerpt from a research article in electrical engineering. Is the writer simply “**name-dropping**” or just “**dumping**” a number of apparently unrelated studies? Moreover, this text seems to violate the given-new principle, since it has no unifying concept that would link together these six different topics (sentences 1-6). What is it that these studies all have in common? When the writer was asked to identify what these studies have in common, he stated that they all tried to make “*TRM failure compensation algorithms for reconstructing the optimal beam pattern*”.

### Exercise 3

Write a suitable topic sentence for introducing this paragraph.

.....  
.....

<sup>1</sup>**Peters [3]** proposed a conjugate gradient method to reconfigure the amplitude and phase distributions; this method involves calculating the sum and difference of the beam pattern of each element. <sup>2</sup>**Yang and Stark [4]** proposed the vector space projection method for recovery of reasonable antenna performance when as many as 30% of the elements are inoperable. <sup>3</sup>**Levitas et al. [5]** introduced a practical method of amplitude and phase compensation using elements near the failed TRM. <sup>4</sup>For simulated annealing technique, **Rodriguez and Ares [6]** proposed array failure correction for planar arrays, and **Lozano et al. [7]** reported compensation while maintaining fixed nulls. <sup>5</sup>**Yeo and Lu [8]** described an approach based on a genetic algorithm (GA). <sup>6</sup>**Rodriguez et al. [9]** also applied a GA for recovering the pattern by changing the excitation of some of the array elements. <sup>7</sup>In previous studies, the optimization algorithms have been frequently used to resynthesize the optimal beam pattern. <sup>8</sup>While this approach is simple and useful, a faster and more accurate method is required for practical applications.

As shown earlier in [Table 3](#), when you cite the work of other authors, you may choose to focus either on the *information* provided by that author, or on the *author him- or herself*. The choice depends on the conventions dictated by your own specific field of science or engineering. The first focus is called **information prominent** because the information is given primary importance:

**Example 1:** *For viscoelastic fluids, the behaviour of the time-dependent stresses in the transient shear flows is also very important (Boger et al., 1974).*

In the second type, **author-prominent** citation, the author's name is given more emphasis. It serves as the subject of the sentence, followed by the date or citation number in parentheses, and then by the information. Such citations can be either **strong** or **weak**, depending on how much emphasis is placed on the identity of the author:

**Example 2:** *Close (1983) developed a simplified theory using an analogy between heat and mass transfer and the equivalent heat transfer only case. (strong)*

**Example 3:** *Several authors have suggested that automated testing should be more readily accepted (Balcer, 1989; Stahl, 1989; Carver and Tai, 1991). (weak)*

## Exercise 4

Convert **Example 1** into an “**author-prominent**” sentence and **Examples 2 and 3** into “**information-prominent**” sentences. How does the emphasis change in each one?

**Example 1:**

.....  
.....  
.....

**Example 2:**

.....  
.....  
.....

**Example 3:**

.....  
.....  
.....

## 6. Citation and Tense

When reviewing previous literature, the writer needs to relate **what** has been done (or proposed) with **who** has done (or proposed) it. However, before starting to list individual studies and their authors, it is important that you first introduce them. For this purpose, good writers use the following three sentence patterns as strategies introducing a topic area.

**Strategies 5-7** can serve as **(1) a topic sentence** that sets the scene for a listing of previous research work, in which each subsequent sentence uses an *author-prominent* strategy to support a claim made in the topic sentence; **(2)** as a “**bridge**” between two major topics; **(3)** as a quick summary describing the **current focus** of a research field [Move 1-3]; or **(4)** as the **first part** in a description of **a gap** [Move 2-1] by introducing a topic area that has already been filled by previous research, before going on to identify neglected areas that have received “little” or “no” attention in the literature. See **Appendix 3** to find out more about the vocabulary typically used in these topic sentences.

### Exercise 5: Reviewing the literature

**Avoid senseless name-dropping!**

1. What topic sentence could introduce this list of previous research?
2. This paragraph uses three different tenses: *Present*, *past* and *present perfect*. What does the writer’s choice of these tenses indicate?

.....  
.....

<sup>21</sup>In [22], the authors explored the possibility of using economic concepts for sensor management without explicitly formulating a specific problem. <sup>22</sup>The authors in [23] used the concept of Walrasian equilibrium [25] to model market-based sensor management.

<sup>23</sup>In [24], the authors also proposed a Walrasian equilibrium-based dynamic bit allocation scheme for target tracking in energy- constrained wireless sensor networks (WSNs) using quantized data. <sup>24</sup>However, as shown in [26], Walrasian markets can be unstable and can fail to converge to the equilibrium. <sup>25</sup>Moreover, computing the equilibrium prices and allocations can be computationally prohibitive. <sup>26</sup>Accordingly, the authors ([23] and references therein) proposed algorithms to compute an approximate equilibrium.

<sup>27</sup>However, the mechanisms proposed in [23], [24] are not truthful and are, therefore, prone to market manipulations.

## Tense choice

Tense choice in reviewing previous research is subtle and somewhat flexible. The following, therefore, are only general guidelines for tense usage. Several studies have shown that at least two-thirds of all citing statements fall into one of these three major patterns. For more information about tense, see [Appendix 6](#).

### I. **Past /Present—Researcher** as sentence “*subject*”:

Jones et al. (2014) **developed** a method for forecasting waste water flows.

Smith et al. [19] **develop** a method for partitioning tasks on network processors.

**Pattern I**—reference to *single* studies

→ **Past** (SCI, CHEM, ENG)

→ **Present** (ELEC)

### II. **Present perfect—Research activity** as sentence “*subject*”:

An integrated model **has** recently **been developed** to forecast waste water flows [34].

A method for partitioning tasks on network processors **has been presented** in Smith [63]

Various studies **have focused** on modelling higher order association rules.<sup>1-3</sup>

**Pattern II**—reference to *areas of inquiry*

→ **Present perfect**

### III. **Present—no reference** to researcher activity (i.e., uses verbs *to be* or *to have*)

Various techniques **are** typically **used** to spectrally estimate slowly varying noise.

Intelligent building systems (IBS) **are integrated** into many services and subsystems.

**Pattern III**—reference to state of *current knowledge* → **Present**

## **Exercise 6: Citation and tense**

Which tense pattern (I,II, or III) would be used for the following reporting verbs.

1. Previous work [3] (show) the limitations of the two protocols.
2. English, German, Japanese, Korean, and Greek (be) some of the languages for which complete ToBI system descriptions exist [8].
3. Multipath routing in ad hoc networks (propose) in [5]-[12].
4. Recently, several different multipath routing protocols based on DSR or AODV (propose). In [5], Lee and Gerla (propose) Split Multipath Routing.
5. In [12], the authors (present) an automatic pitch accent and boundary tone labeling system which predicts pitch accent labels and boundary tone types using a multilevel hierarchical model based on a decision tree framework.
6. Various hybrids of the approximate continuous-time and exact sampled-data models (describe), for example, in [14] and [15].
7. The smoothness of the resulting correlation measure with respect to shape perturbations and changes in transformation parameters (enable) the use of very efficient pruning and hierarchical techniques for matching [3] [12] [6].
8. Over the last decade, appearance models [4], [20] (become) increasingly prominent in computer vision.
9. Outside of the facial expression literature, unsupervised temporal segmentation and clustering of human and animal behavior (address) by several groups. Zelnik-Manor and Irani [33] (extract) spatio-temporal features at multiple temporal scales to isolate and cluster events. Guerra-Filho and Aloimonos [14] (present) a linguistic framework to learn human activity representations.

## 7. Reporting Verbs

There is a range of reporting verbs that you may use when referring to the work of previous researchers. A study by Ken Hyland [4] identified more than 400 different reporting verbs; however, nearly 50% of these were used only one time in his corpus of 80 research articles. Table 4 shows the most frequently used reporting verbs from a variety of disciplines, with the most frequent on the left and the sixth most frequent on the right. As you can see, there are very large differences between disciplines.

**Table 4: The six most frequent reporting verbs according to discipline**

Discipline	Verbs and frequency					
	1	2	3	4	5	6
<b>Biology</b>	describe	find	report	show	suggest	observe
<b>Physics</b>	develop	report	study	find	expand	
<b>Elec. eng.</b>	propose	use	describe	show	publish	develop
<b>Mech eng.</b>	describe	show	report	discuss	give	develop
<b>Medical</b>	find	describe	suggest	report	examine	show
<b>Marketing</b>	suggest	argue	find	demonstrate	propose	show

If you want to say what has been **claimed**, **thought**, or **discovered** either by previous researchers or in your own study, you can use 'it' as the impersonal **subject** of the **passive form** of a reporting verb, followed by a "that" clause. This form is most common in **information-prominent** citations.

Recently, **it has been suggested that** a fully objective AEP may be obtained using phase spectral analysis techniques [4]-[7].

In [19] **it was shown that** these approximations are often considerably more accurate than the conventional approximations in [1], [7], and [26].

In [8], **it was concluded that** the robot system requires a body inclination sensor, and a ground reaction force sensor for each foot.

Table 5 lists the reporting verbs that can be used in the passive with a **dummy "it"** as their subject:

**Table 5:** Verbs that can be used with introductory "it."

accept	comment	emphasize	<b>*know</b>	<b>*show</b>
acknowledge	concede	establish	note	<b>*speculate</b>
admit	conclude	estimate	<b>*observe</b>	state
agree	confirm	expect	postulate	<b>*suggest</b>
allege	conjecture	feel	predict	suppose
anticipate	consider	<b>*find</b>	presume	surmise
argue	decide	hold	propose	suspect
assert	<b>*demonstrate</b>	hope	<b>*recognize</b>	<b>*think</b>
assume	determine	<b>*hypothesize</b>	recommend	understand
<b>*believe</b>	discover	imply	record	
claim	document	indicate	<b>*report</b>	

The verbs highlighted in blue and bold above are the small group of verbs which can be used in the **passive form** with the **infinitives to be** and **to have**:

*The differences in the density of defects created by these two kinds of particles **have been suggested to have** an important influence on thermal generation [18].*

*These **have been shown to be** a useful component in the design of reconfigurable multi-band antennas where the feed network of a patch array is reconfigured [25].*

*For a long time, *the application of Si-based bipolar technology* **has been believed to be** limited up to 10 Gb/s systems mainly due to its operation speed limit, despite advantages such as high reliability and low cost.*

For a more complete discussion of reporting verbs, see [Appendix 7: Reporting verbs](#) at the [Aalto Writing Clinic](#) web site.
